8 Appendix and Supplementary Information

8.1 A Formal Insurance Model of Redistribution Preferences

This appendix states the model behind Section 2.4 and gives the exact expressions for its comparative statics.

Primitives. Let us write the individual's income before taxes as y, mean income as $\bar{y}$, and relative income as $\xi \equiv y/\bar{y}$. She experiences a temporary spell of displacement with probability p and keeps her job and earns y with probability $1-p$. Let $\mu \in [0,1]$ be the expected share of the period spent unemployed, $\rho \in [0,1]$ the wage ratio on reentry (so $1-\rho$ is scarring), b the benefit replacement rate tied to earnings, and B the benefit duration as a share of the period. We can express her income in the bad state as δy, with

$$\delta \;=\; (1-\mu)\,\rho \;+\; b \cdot \min(\mu, B). \tag{6}$$

Note that we derive δ from four separately observable components rather than setting a free parameter summarizing protection. Each institution enters through the component on which it acts in (6).

Policy. A linear tax $\tau \in [0,1]$ on income funds transfers that accrue at rate θ_g in the good state and θ_b in the bad state, with $\theta_b \geq \theta_g \geq 0$. The distinction between δ and θ depends on one condition, namely whether payments are proportional to the individual's own prior earnings. Payments in δ scale with those earnings and are exogenous to her policy choice, while θ collects flat payments that scale with the chosen tax rate. Unemployment insurance tied to earnings therefore belongs in δ, with flat benefits and social assistance in θ_b. Consumption is affine in τ,

$$c_g \;=\; \xi - \tau(\xi - \theta_g), \qquad c_b \;=\; \delta\xi + \tau(\theta_b - \delta\xi). \tag{7}$$

Preferences and objective. Utility is CRRA, $u(c) = c^{1-\sigma}/(1-\sigma)$ for $\sigma > 0$, with $u(c) = \ln c$ at $\sigma = 1$. The individual maximizes expected utility,

$$V(\tau) \;=\; (1-p)\,u(c_g) \;+\; p\,u(c_b). \tag{8}$$

Since CRRA is homothetic, only relative income matters and we set $\bar{y} = 1$.

Interior region. Assume

$$\delta\xi \;<\; \theta_b, \qquad \theta_g \;<\; \xi. \tag{9}$$

This means that the individual is a net contributor when employed under the second inequality and a net recipient when displaced under the first, facing an insurance tradeoff. On the other hand, if the individual falls outside this region, the problem has a corner solution.

Solution and comparative statics. To ease notation, write $A \equiv \xi - \theta_g$, $C \equiv \theta_b - \delta\xi$, $G \equiv \theta_b - \delta\theta_g$, and $D \equiv A + \kappa C$.

Proposition 1 (Optimal tax rate)**.** *Under* (9)*, V is strictly concave in τ and the optimum is*

$$\tau^* \;=\; \frac{\xi\,(1-\kappa\delta)}{D}, \qquad \kappa \;\equiv\; \left[\frac{(1-p)\,A}{p\,C}\right]^{1/\sigma}, \tag{10}$$

interior whenever $\kappa\delta < 1$ and $\tau^* < 1$.

Proof. Taking the first order condition $V'(\tau) = 0$ gives $(c_g/c_b)^\sigma = (1-p)A/(pC)$, and hence $c_g = \kappa c_b$. $V''(\tau) = -\sigma(1-p)A^2 c_g^{-\sigma-1} - \sigma p C^2 c_b^{-\sigma-1} < 0$, so the critical point is the global maximum. Substituting (7) into $c_g = \kappa c_b$ and solving for τ yields (10). □

The auxiliary variable $\kappa = c_g/c_b \geq 1$ is the risk the individual still bears at her chosen policy. The risk slope, the model analogue of the estimated slopes β_{ct}, has a closed form,

$$\beta \;\equiv\; \frac{\partial \tau^*}{\partial p} \;=\; \frac{\xi\,G\,\kappa}{\sigma\,p\,(1-p)\,D^2}. \tag{11}$$

Proposition 2 (Risk raises demand unconditionally)**.** *If $\theta_b > \delta\theta_g$, then $\partial\tau^*/\partial p > 0$ throughout the interior region, for every $\sigma > 0$ and $\delta \in [0, 1)$.*

Proof. Since $\partial\tau^*/\partial\kappa = -\xi G/D^2 < 0$ and $d\kappa/dp = -\kappa/[\sigma p(1-p)] < 0$, their product (11) is positive. □

If $\theta_b \geq \theta_g$ and $\delta < 1$, this implies $\theta_b > \delta\theta_g$, so the condition does not bind in any case of interest.

Proposition 3 (The risk slope declines in baseline risk)**.** *With $r \equiv A/(\kappa C)$,*

$$\text{sign}\left(\frac{\partial\beta}{\partial p}\right) \;=\; \text{sign}\left\{(2p-1) \;+\; \frac{1-r}{\sigma(1+r)}\right\}. \tag{12}$$

A sufficient condition for a negative sign is $p \leq 1/2$ and $r \geq 1$.

Proposition 4 (The curvature effect vanishes at log utility)**.** *At $\sigma = 1$, $r = p/(1-p)$ and the bracket in Proposition 3 is identically zero, so $\partial\beta/\partial p = 0$ for every interior p.*

Proof. At $\sigma = 1, \kappa = (1-p)A/(pC)$, so $r = A/(\kappa C) = p/(1-p)$. Then $1-r = (1-2p)/(1-p)$ and $1+r = 1/(1-p)$, so $(1-r)/(1+r) = 1-2p$ and the bracket is $(2p-1)+(1-2p) = 0$. □

Hence, the two sufficient conditions cannot both hold at log utility. For $p < 1/2$ the first holds, but the second fails exactly because $r = p/(1-p) < 1$. We need curvature in utility beyond the logarithmic case for this effect of second order, whose strength increases as σ rises above one.

Proposition 5 (The income effect is not signed)**.**

$$\frac{d\tau^*}{d\xi} \;=\; \frac{(\kappa\theta_b - \theta_g)(1-\kappa\delta) \;-\; \xi G\kappa'_\xi}{D^2}, \qquad \kappa'_\xi \;=\; \frac{\kappa}{\sigma}\left(\frac{1}{A} + \frac{\delta}{C}\right). \tag{13}$$

The two terms oppose each other, and the balance depends on σ. As $\sigma \to \infty$, κ'_ξ vanishes and insurance behaves as a normal good, with a positive effect as in the region described by Moene and Wallerstein (2001). On the other hand, at low σ the second term dominates, making the effect negative as in the benchmark of Meltzer and Richard (1981).

Proposition 6 (The income-by-risk interaction is not generic)**.**

$$\frac{\partial \ln\beta}{\partial\xi} \;=\; \frac{1}{\xi} \;+\; \frac{\kappa'_\xi}{\kappa} \;-\; \frac{2\,(1-\kappa\delta+\kappa'_\xi C)}{D}. \tag{14}$$

The sign requires a joint restriction on risk aversion, loss severity, and transfer targeting. Positive signs concentrate at σ near two or above with δ bounded away from zero, or under narrow targeting.

Proposition 7 (Transfers and retention move the slope in opposite directions)**.**

$$\frac{\partial \ln \beta}{\partial \theta_b} \;=\; \frac{1}{G} - \frac{1}{\sigma C} - \frac{2\kappa\,(1-1/\sigma)}{D}, \qquad \frac{\partial \ln \beta}{\partial \delta} \;=\; -\frac{\theta_g}{G} + \frac{\xi}{\sigma C} + \frac{2\kappa\xi\,(1-1/\sigma)}{D}. \tag{15}$$

The derivatives in Proposition 7 have no global sign.

Proposition 8 (Sufficient conditions for the transfer and retention signs)**.** *With $r \equiv A/(\kappa C)$ as in Proposition 3,*

$$\frac{\partial \ln \beta}{\partial \theta_b} \;=\; -\frac{\delta A}{GC} \;+\; \frac{(\sigma-1)(r-1)}{\sigma}\,\frac{\kappa}{D}, \qquad \frac{\partial \ln \beta}{\partial \delta} \;=\; \frac{\theta_b A}{GC} \;-\; \frac{(\sigma-1)(r-1)}{\sigma}\,\frac{\xi\kappa}{D}, \tag{16}$$

and the two derivatives satisfy the identity

$$\xi\,\frac{\partial \ln \beta}{\partial \theta_b} \;+\; \frac{\partial \ln \beta}{\partial \delta} \;=\; \frac{A}{G} \;>\; 0. \tag{17}$$

Whenever $(\sigma-1)(r-1) \le 0$, raising the flat transfer weakly lowers the risk slope, strictly when $\delta > 0$, and raising the retention share strictly raises it. At $\sigma = 1$ both signs hold unconditionally, with $\partial \ln \beta/\partial \theta_b = -\delta A/(GC)$ and $\partial \ln \beta/\partial \delta = \theta_b A/(GC)$ exactly. By (17)*, the retention derivative exceeds $A/G > 0$ whenever the transfer derivative is negative. In primitives, $r \lessgtr 1$ is equivalent to $(A/C)^{\sigma-1} \lessgtr (1-p)/p$. For example, $A \le C$ and $p \le 1/2$ imply $r \le 1$ for every $\sigma \ge 1$.*

Proof. From Proposition 7, we have $1/G - 1/C = (C-G)/(GC) = -\delta A/(GC)$ and $\xi/C - \theta_g/G = \theta_b A/(GC)$, while $1/C - 2\kappa/D = (A-\kappa C)/(CD) = \kappa(r-1)/D$. Substituting gives (16). Then $\xi\,\delta A/(GC)$ cancels against $\theta_b A/(GC)$ minus $AC/(GC)$, so (17) follows by direct addition. On the interior region, we have that the first terms carry the stated signs while the correction terms share the factor $(\sigma-1)(r-1)$ with opposite signs, and hence the decomposition yields the sign statements. We get the primitive form $r = (A/C)^{1-1/\sigma}\,[(1-p)/p]^{-1/\sigma}$ by substituting κ into $r \equiv A/(\kappa C)$. □

Note that r compares the share of her consumption that taxation takes when she is employed

with the share it adds when she is displaced, and the condition $(\sigma - 1)(r - 1) \leq 0$ holds when her risk aversion and this ratio sit on opposite sides of one. The transfer derivative reverses only outside the sufficient region, mostly at small δ (on the appendix grids). In order to observe a reversal of the retention derivative as well, we need that $\xi \, \partial \ln \beta / \partial \theta_b > A/G$, by the identity (17). This condition holds on under one percent of interior draws.

The last result states that the same unemployment insurance policy buffers the exposure gradient if written as a transfer and amplifies it if written as retained income. Since unions and bargaining coverage act at once on several primitives, ρ, the separation rate, and θ_b, the model leaves them unsigned. The wage ratio on reentry ρ has no series by country and year, and benefit duration B is unsigned once we let its behavioral effect on μ vary over the range documented in work using quasi experiments. With these restrictions, three of the five primitives are signed and two are unsigned.

Remark 1. In addition to verifying the exact expressions above symbolically (`sympy`, with all verification code in the replication materials), we checked the closed form (10) against direct numerical maximization of (8) on 2,533 interior draws, with no discrepancy above 10^{-5}. We mapped the sign regions reported for Propositions 3 through 6 numerically over interior draws spanning $\xi \in [0.3, 3]$, $p \in [0.02, 0.5]$, $\delta \in [0, 0.8]$, $\sigma \in [0.4, 4]$, $\theta_g \in [0, 1]$, and $\theta_b \in [\theta_g, 2]$.

Nested cases. In the limit $p \to 0$, her insurance motive vanishes and she chooses her tax rate on the redistributive motive alone (Meltzer and Richard, 1981). Set $\theta_g = 0$, $\delta = 0$, $\sigma = 1$ in (10). Then her preferred tax rate becomes $\tau^* = p$, the knife edge case in Alt and Iversen (2017). In other words, her preferred tax rate equals the probability of falling into poverty and is independent of her own income. The closed form derived by Pahontu (2022), $\tau^* = p \, \xi / (\xi - \gamma)$, corresponds to $\theta_g = \gamma$, $\theta_b = 1 - \gamma$, $\delta = 0$, $\sigma = 1$. For high σ with $\delta \approx 0$, $d\tau^*/d\xi > 0$ as in Moene and Wallerstein (2001). The meta analyses invoked for Proposition 5 find that, after correction for publication bias, estimates of relative risk aversion center on one (Elminejad et al., 2022). At that value, the model rules out both the Moene–Wallerstein region and the positive interaction between income and risk.

Mapping to automation exposure. Let us write occupational automation exposure as a, and let $p = p(a), \xi = \xi(a), \delta = \delta(a)$. Thus, we can express the change in her preferred tax rate with exposure as

$$\frac{d\tau^*}{da} = \frac{\partial\tau^*}{\partial p}\frac{dp}{da} + \frac{\partial\tau^*}{\partial \xi}\frac{d\xi}{da} + \frac{\partial\tau^*}{\partial \delta}\frac{d\delta}{da}, \tag{18}$$

where the three terms on the right side are a risk channel, an expected wage channel, and a severity channel, so an estimated exposure coefficient combines the three. Note that the model signs only the risk channel. This is one reason we do not treat the paper's mechanism analyses as tests.

8.2 Supplementary Figures and Tables

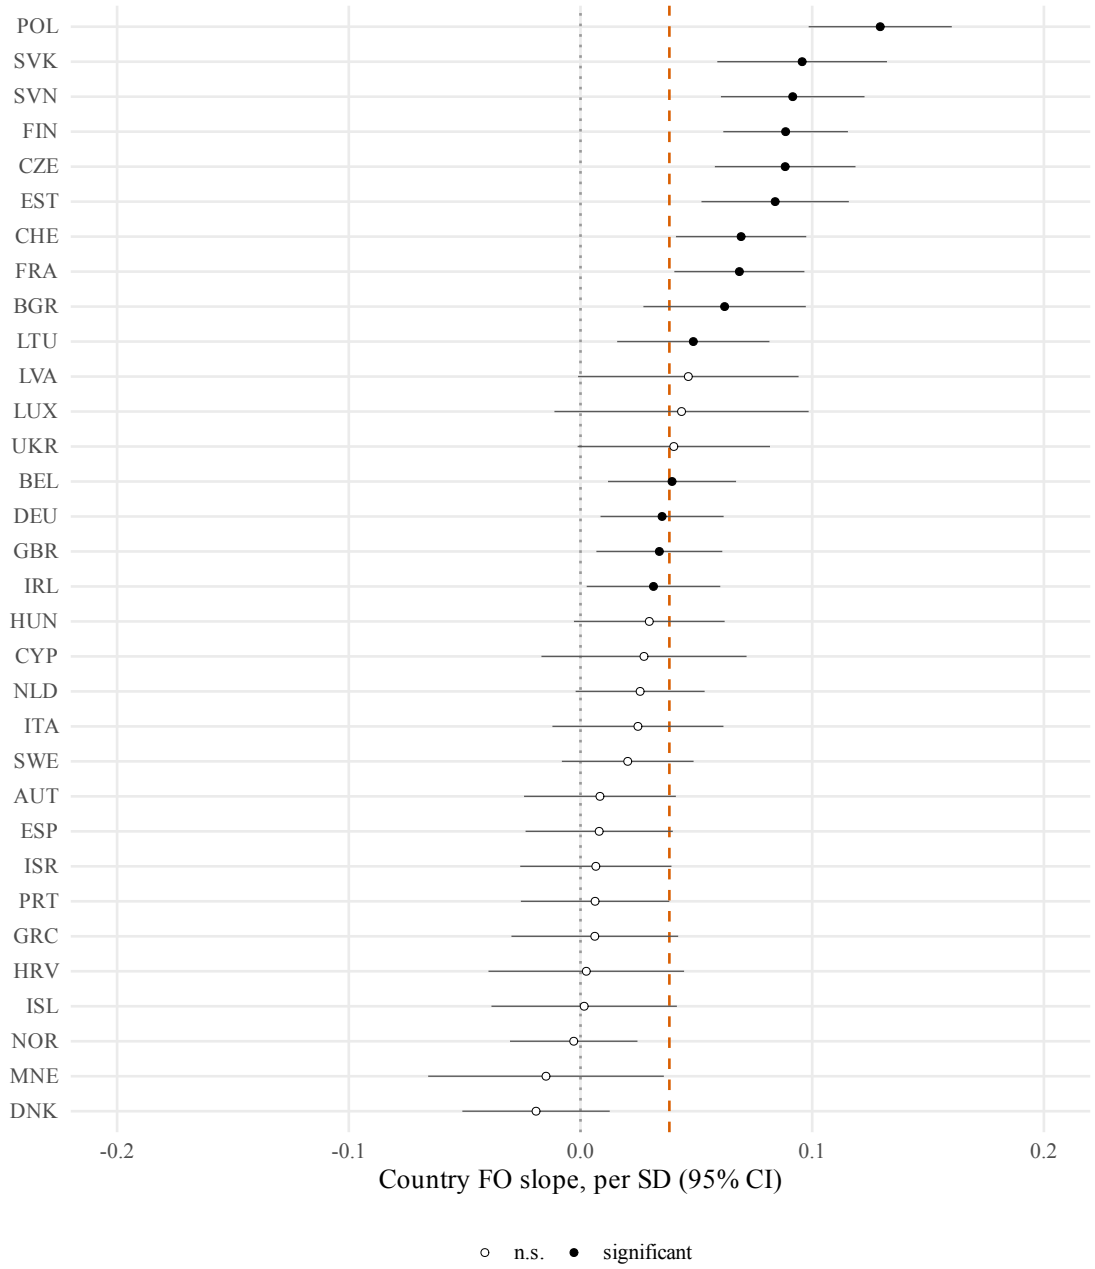

The material in this appendix covers robustness results for RTI, country and year slope profiles, composition aggregates, latest-wave country estimates, mediation diagnostics, a single-wave diagnostic of exposure and perceived vulnerability, and the institutional two-stage diagnostic.

Table 4: Global RTI automation–redistribution association: published benchmark and post-estimation window aggregates of the single heterogeneity model

Quantity	Years	Scale	Estimate	95% CI	N	Countries
Published benchmark	2002–2012	per SD	0.042	–	64,639	17
Window aggregate of $\beta_{c,t}$	2002–2014	native	0.042	[0.024, 0.060]	107,225	31
Window aggregate of $\beta_{c,t}$	2016–2022	native	0.012	[-0.008, 0.031]	66,226	31
Full-panel aggregate of $\beta_{c,t}$	2002–2022	native	0.030	[0.012, 0.048]	173,451	32
Benchmark-roster aggregate	2002–2014	native	0.042	[0.023, 0.061]	76,294	17
Benchmark-roster aggregate	2016–2022	native	0.012	[-0.008, 0.033]	40,056	16
Benchmark-roster aggregate	2002–2022	native	0.032	[0.013, 0.050]	116,350	17
Full-panel aggregate of $\beta_{c,t}$	2002–2022	per SD	0.028	[0.012, 0.045]	173,451	32

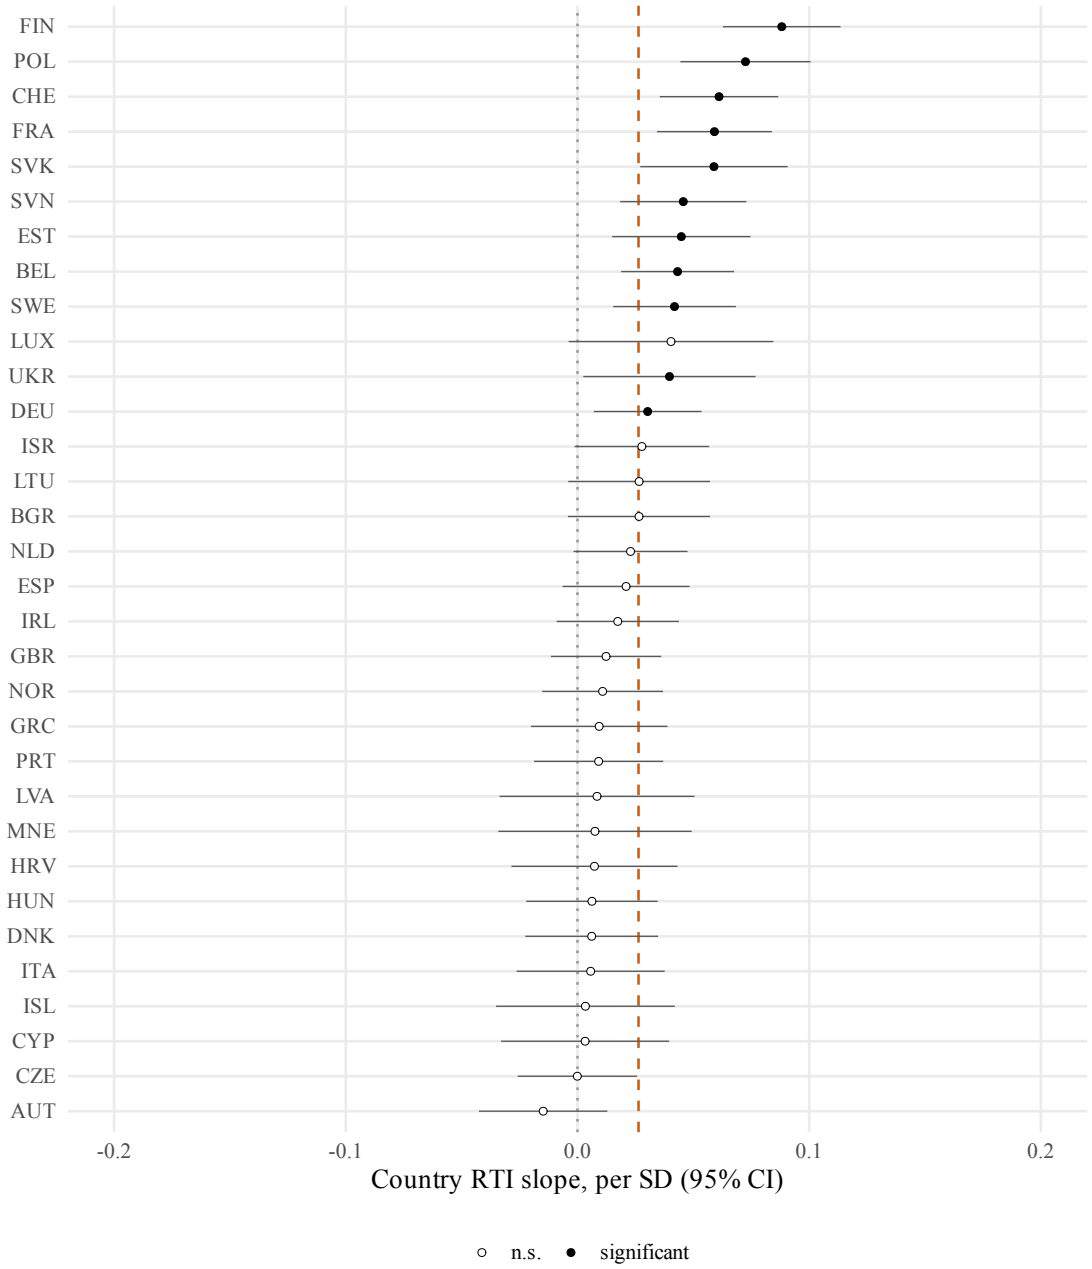

Window aggregates are equal-weighted means of the country-year slopes $\beta_{c,t}$ from the single multilevel heterogeneity model; no additional model is estimated. The model adjusts for relative equivalized household income, years of education, gender, age, union membership, religiosity, and unemployment status, with ESS design weights. Benchmark-roster rows restrict the aggregation to the seventeen countries of the published benchmark's sample, holding country composition fixed at the benchmark roster. Native-scale entries divide the per-SD aggregate by the pooled exposure SD. Intervals carry over the fixed-slope sampling variance and the aggregated conditional variances of the slope components; cross-component posterior covariances are ignored. The published-benchmark row is quoted from Thewissen and Rueda (2019) as an external reference.

Figure 9: Marginal country slopes from the single heterogeneity model, Frey–Osborne

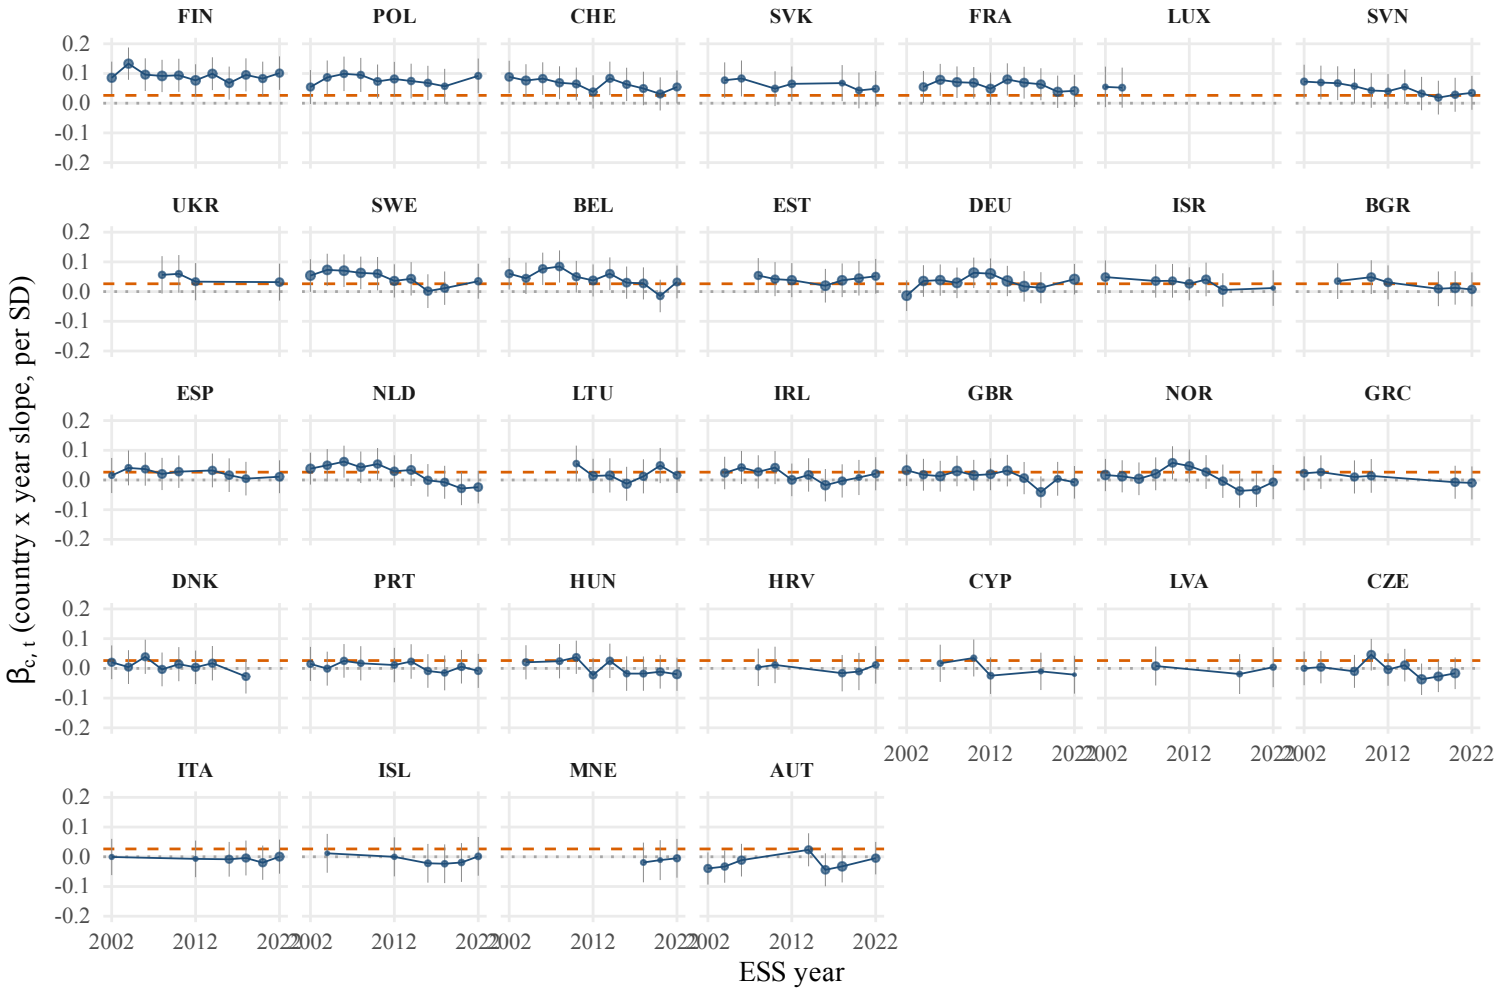

Note: Country slopes are the fitted $\gamma + u_c$ (global slope plus country deviation) from the single model. Dashed orange = global slope; dotted line at zero. Effect axis fixed at $[-0.20, +0.20]$, shared across all slope figures.

Figure 10: Marginal country slopes from the single heterogeneity model, RTI

Note: As in the preceding figure.

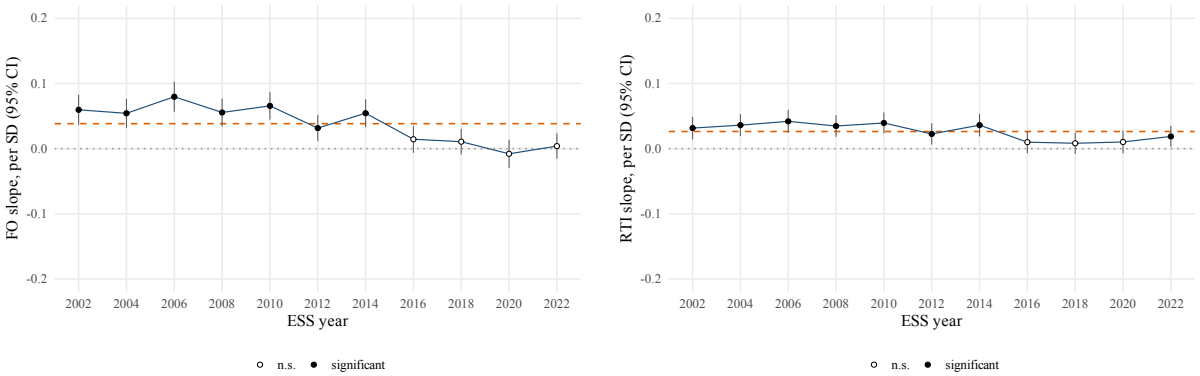

Figure 11: RTI robustness: country-by-year heterogeneity in the automation–redistribution association

Note: Each panel is a country, ordered by mean slope; point size scales with cell N. Dashed orange = global slope; dotted line at zero. Whiskers are 95% intervals from the fitted slopes, cropped at the panel edge where they exceed the range. Effect axis fixed at $[-0.20, +0.20]$, shared across all slope figures.

Figure 12 plots the fitted year slopes; their between-year standard deviation is 0.030 under Frey–Osborne and 0.015 under RTI.

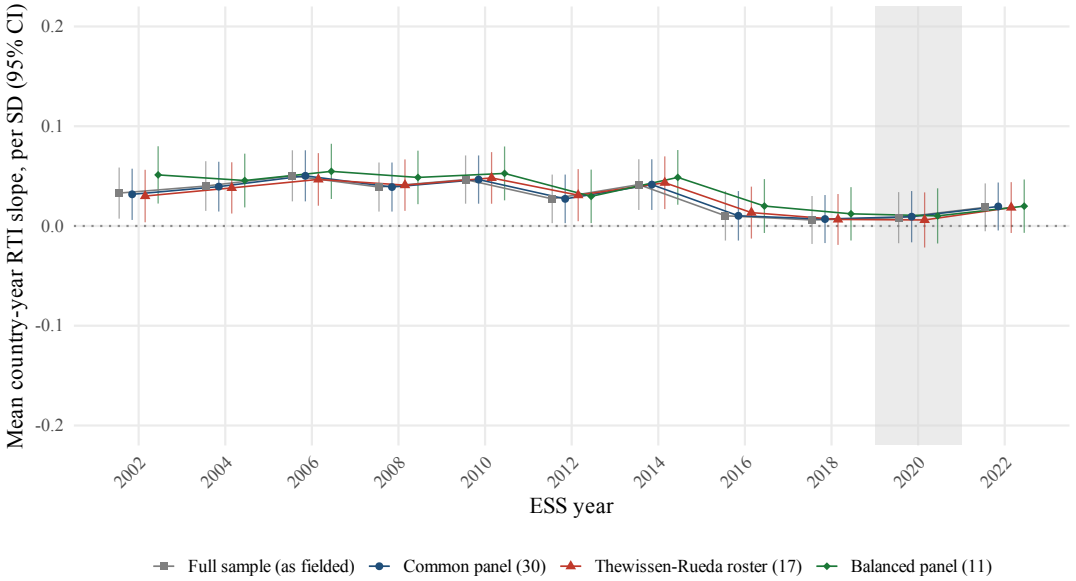

Figure 12: Marginal year slopes from the single heterogeneity model (composition-confounded)

Note: Left panel: Frey–Osborne; right panel: RTI. Points are the fitted $\gamma + v_t$ year slopes from the single model (aggregates controlling for composition in Figures 3 and 13). Dashed orange = global slope; dotted line at zero. Effect axis fixed at $[-0.20, +0.20]$, shared across all slope figures.

Figure 13 gives the RTI counterpart to Figure 3. The RTI series also differ in level across rosters, decline after 2014, and partly recover in 2022.

Figure 13: RTI robustness: yearly mean country-year slopes under four composition assumptions

Note: Series are offset horizontally to avoid overlap, the shaded band marks the 2020 round (ESS10), which COVID disrupted, and the dotted line is at zero. Whiskers are 95% intervals from the fitted slopes. Effect axis fixed at $[-0.20, +0.20]$, shared across all slope figures.

The membership of each country roster used in the composition analysis appears in Table 5, together with the number of observed waves per country.

Table 5: Country membership in each analysis roster

Waves counts the ESS rounds in which the country appears in the harmonized 2002–2022 panel (eleven rounds). Full: every country fielded in the panel. Common: at least three waves and at least one pre-2016 wave. TR: the seventeen countries of the Thewissen and Rueda (2019) main sample. Balanced: present in all eleven waves. Roster definitions follow the composition analysis code.

The design-weighted mean of both exposure indices is tracked in Figure 14 by round for the seventeen countries of the benchmark roster, and Figure 15 plots the corresponding design-weighted densities by round, with a common bandwidth per index and the earliest round at the top, and the distributions drift toward lower exposure across rounds. The design-weighted Frey–Osborne mean falls from 0.52 in 2002 to 0.47 in 2022, and the RTI mean falls from -0.04 to -0.20 over the same rounds, so the labor force of the benchmark roster moved away from routine-intensive occupations.

Figure 14: Design-weighted mean exposure by ESS round, benchmark roster

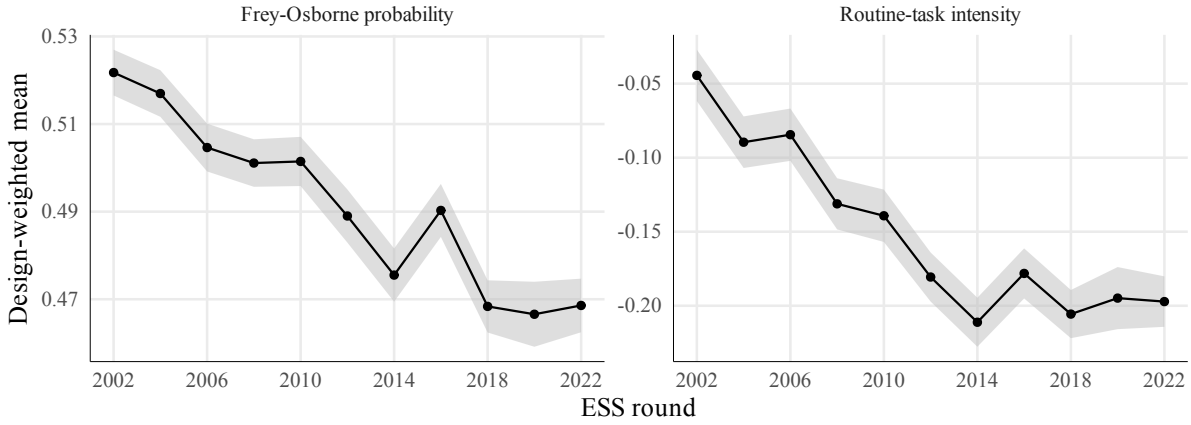

Figure 15: Design-weighted exposure distributions by ESS round, benchmark roster

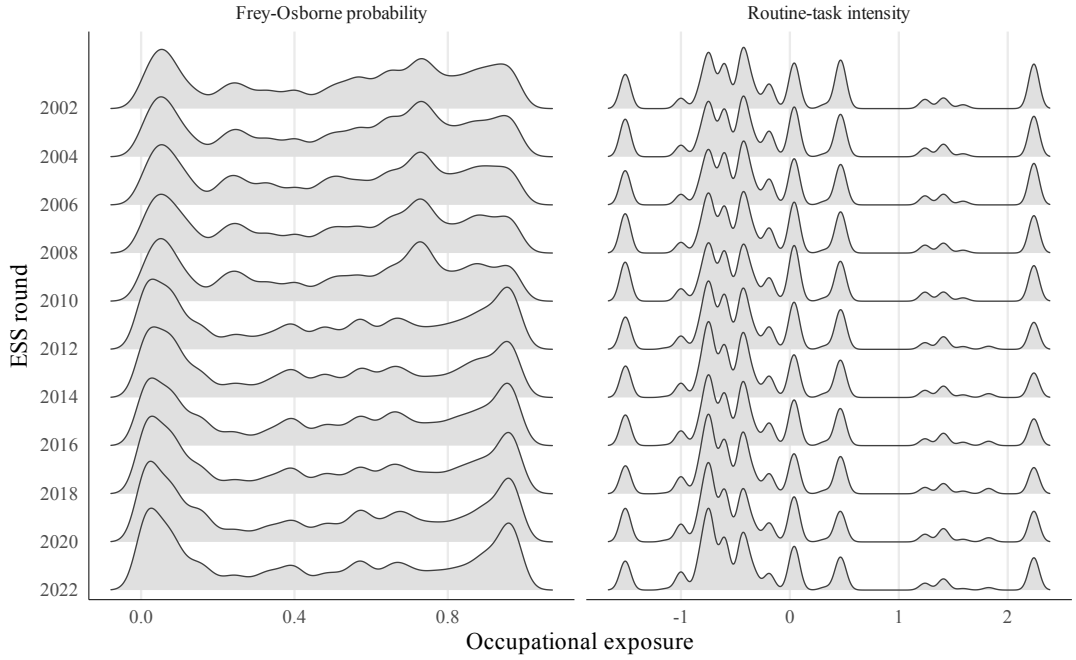

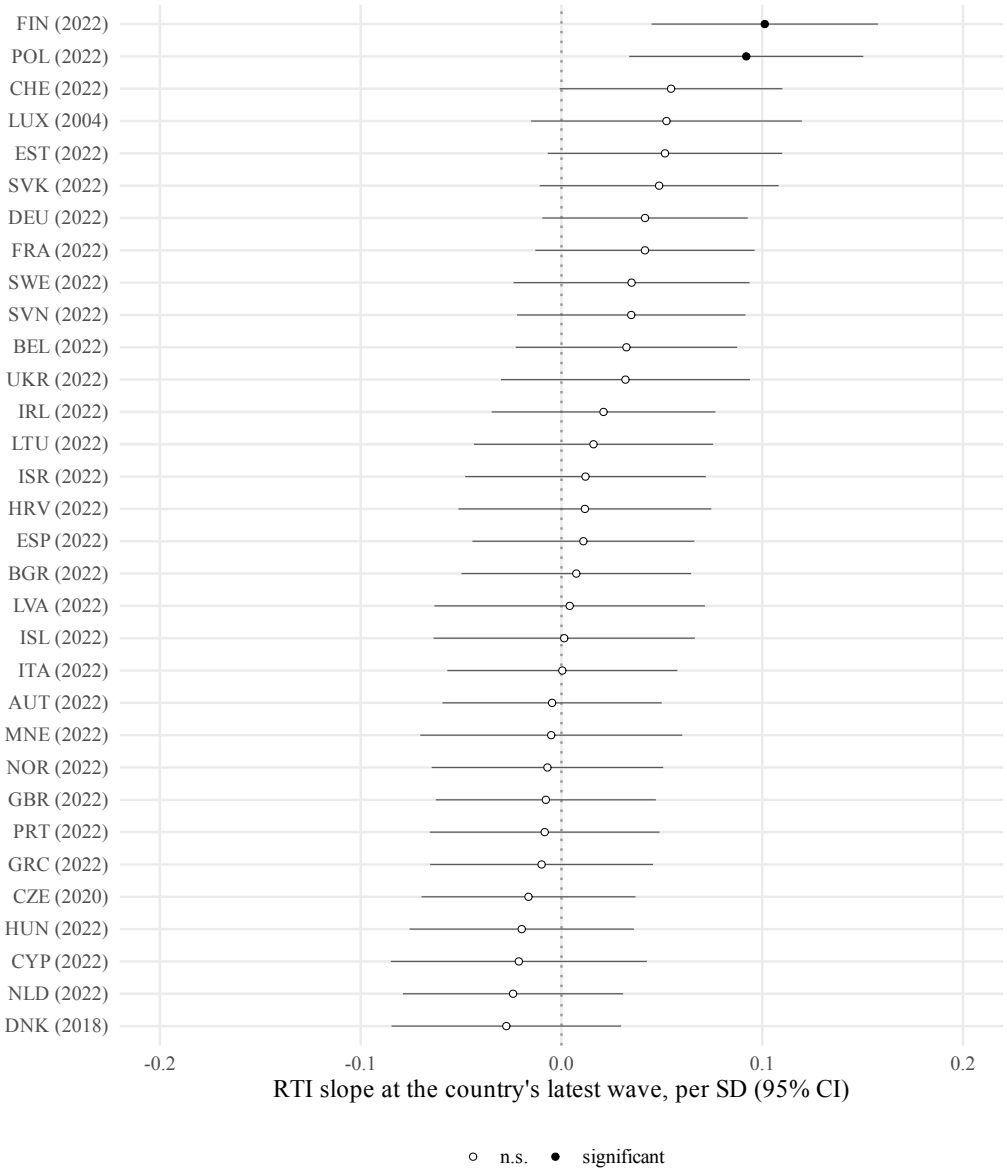

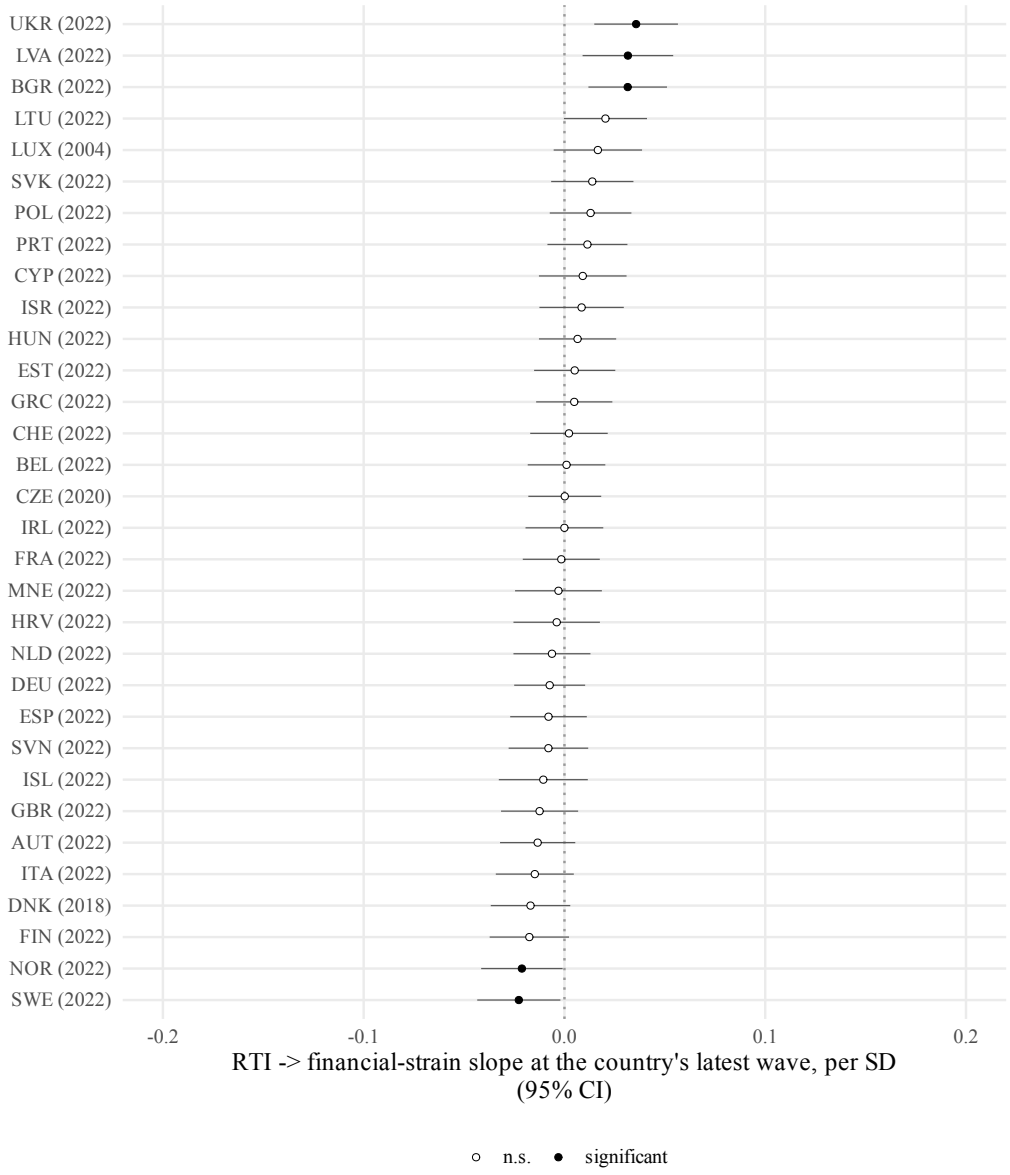

Figure 16: RTI robustness: country marginal effects at the most recent available wave

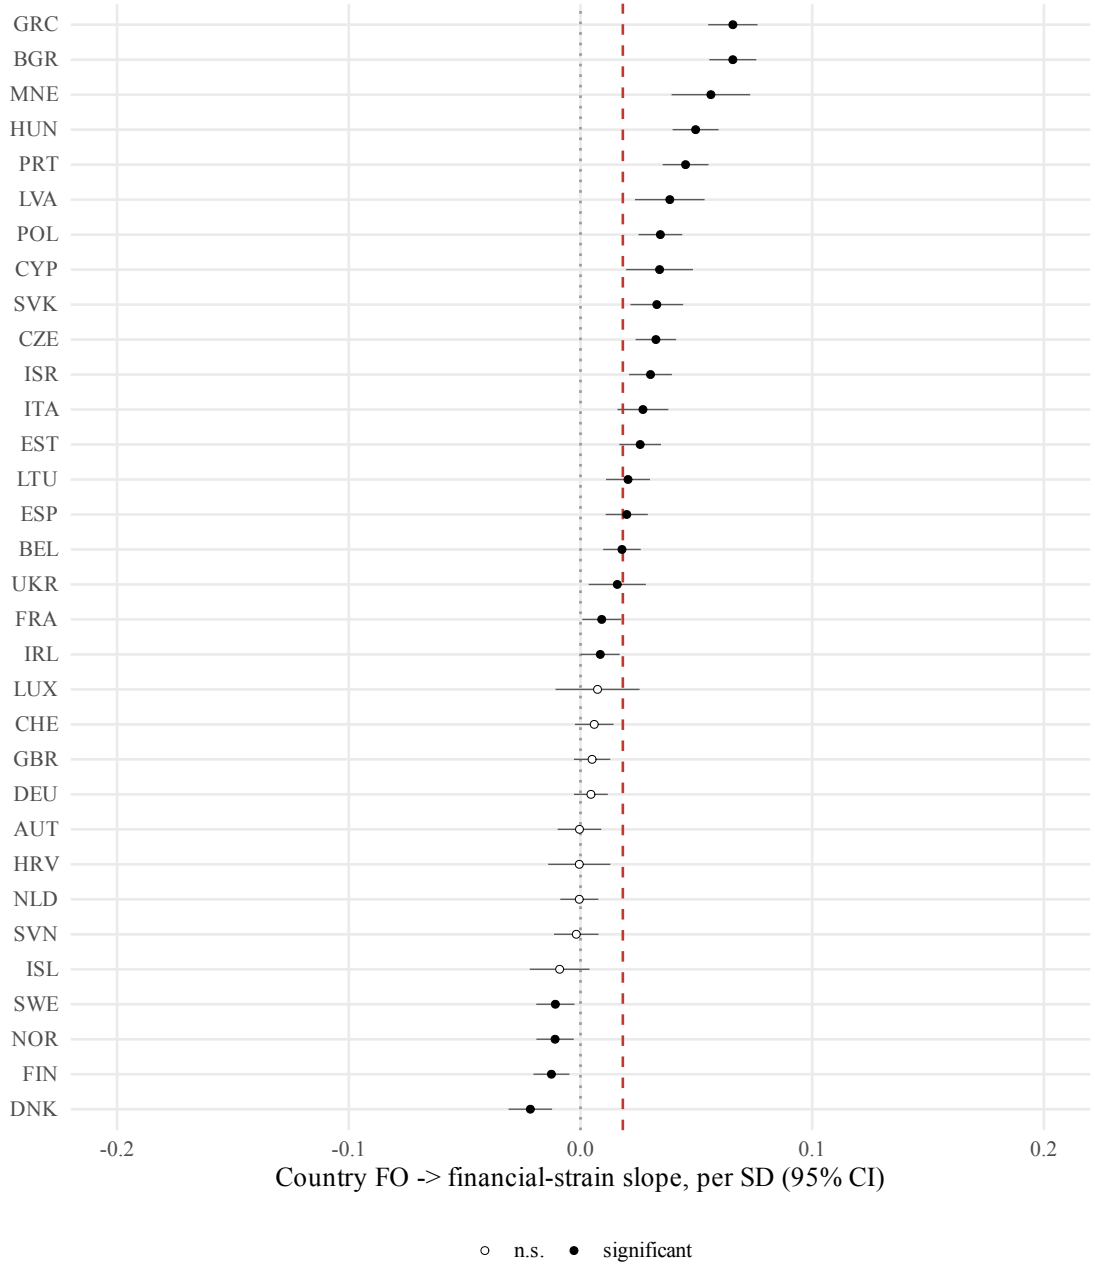

Note: As in the corresponding Frey–Osborne figure in the main text.

Figure 17: RTI robustness: country marginal effects on financial strain at the most recent available wave

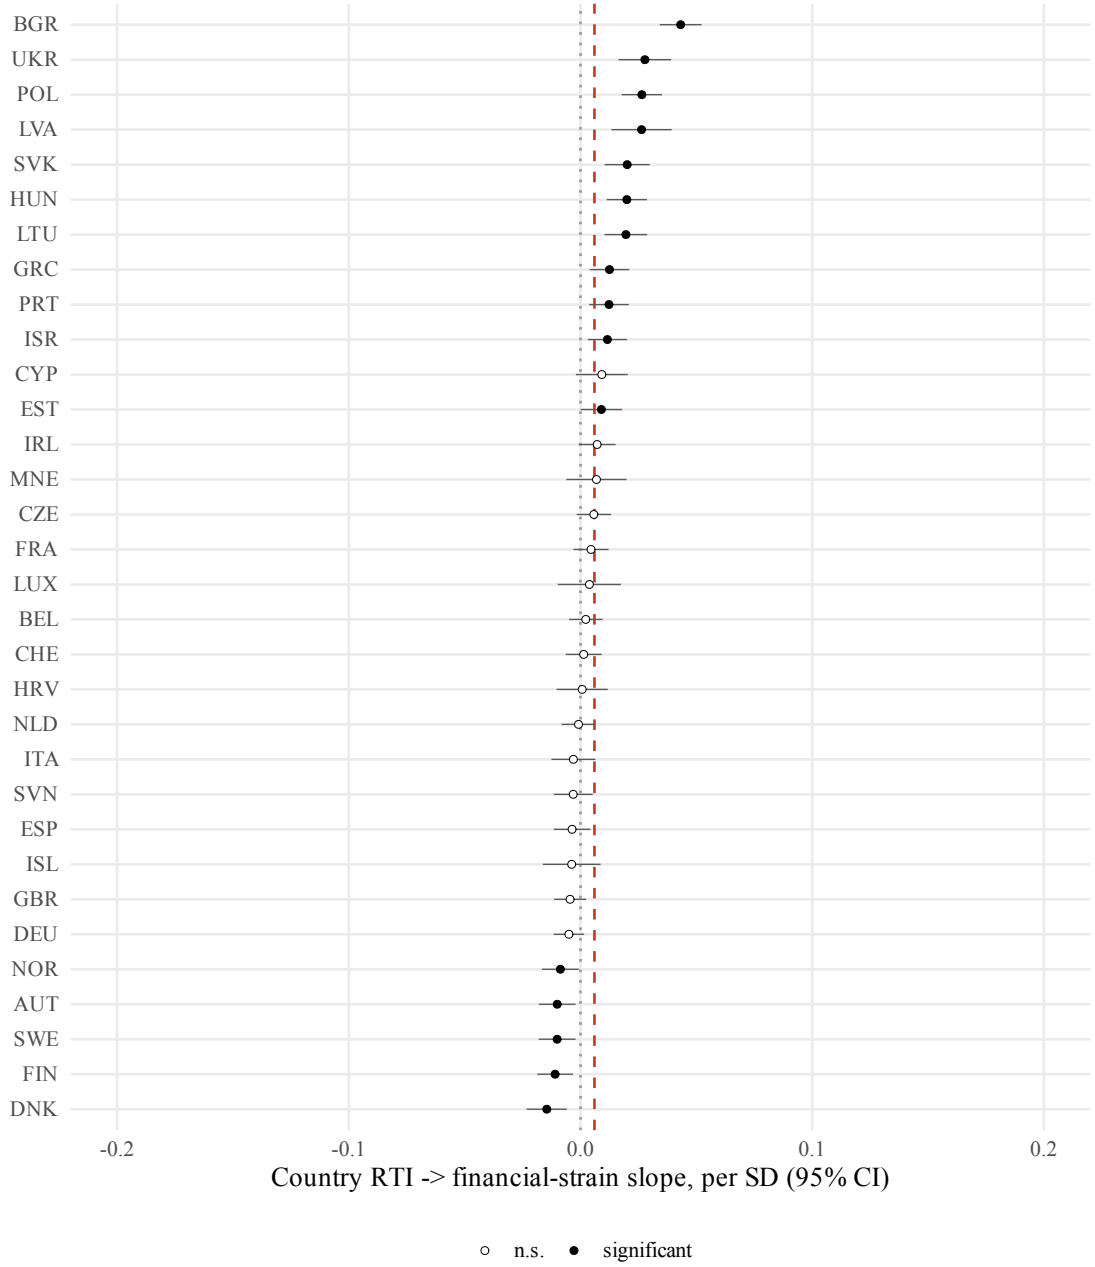

Note: Year in parentheses is each country's most recent ESS round. Whiskers are 95% intervals from the fitted strain slopes, and the dotted line is at zero. Effect axis fixed at $[-0.20, +0.20]$, shared across all slope figures.

Figure 18: Country heterogeneity in automation exposure and financial strain, Frey–Osborne

Note: Country slopes of the exposure–financial-strain association from the shared model; financial strain is difficulty coping on present income. Dashed red = global slope; dotted line at zero. Effect axis fixed at $[-0.20, +0.20]$, shared across all slope figures.

Figure 19: Country heterogeneity in automation exposure and financial strain, RTI

Note: As in the preceding figure.

Table 6: Mechanism diagnostic in the welfare-module rounds: automation risk and perceived economic vulnerability

	Job insecurity		Income insufficiency	
Index	2008	2016	2008	2016
Frey–Osborne probability	0.0311***	0.0232***	0.0250***	0.0187***
N	21540	21153	23237	21927
GMS routine-task intensity	0.0179***	0.0090*	0.0105*	0.0016
N	20271	19128	21921	19884

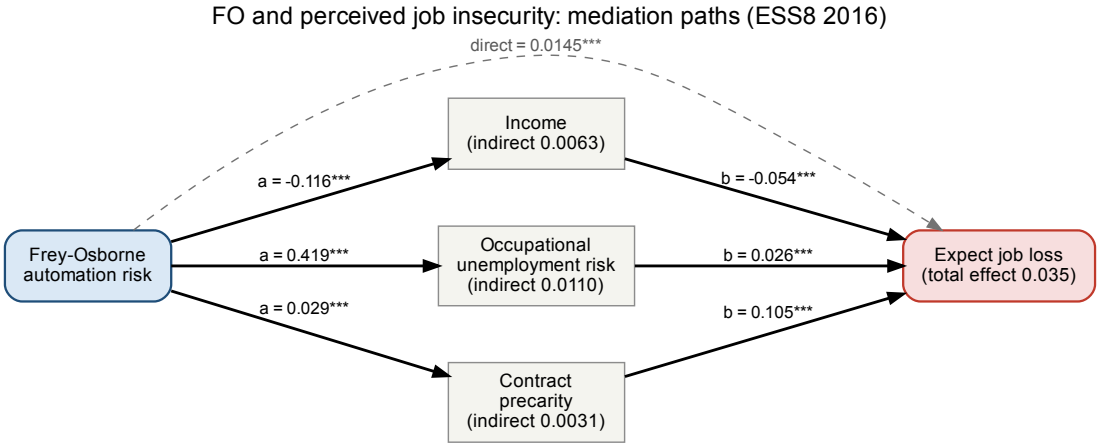

[a] Each cell is the coefficient on the own-occupation automation-risk index in a design-weighted random-intercept linear probability model with country-clustered (CR1) standard errors. The exposure is standardized within the estimation sample, so a coefficient is the change in the probability of feeling vulnerable per one-standard-deviation increase in exposure. "Job insecurity" is a binary indicator for expecting to lose one's job in the next twelve months; "income insufficiency" for expecting income too low to meet needs. The welfare-attitudes module carries both items in the 2008 and 2016 rounds; the job models use the paid-work frame and the income models the labor-force frame.

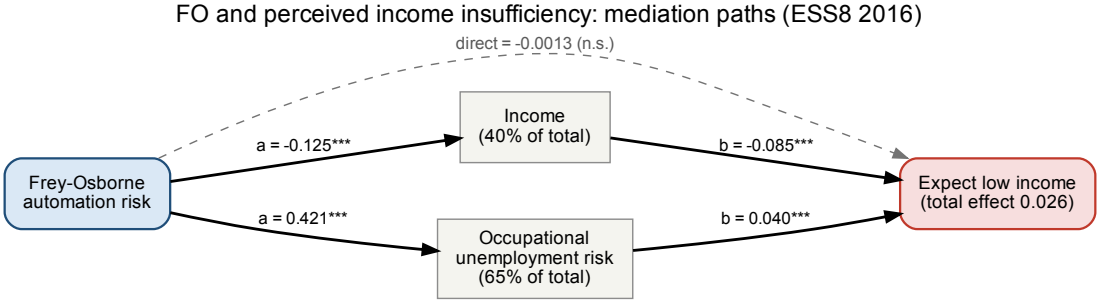

[b] Stars are Holm-adjusted within each outcome-wave across the two indices: * $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$. The confirmatory registration covers the 2016 round; the 2008 columns are an out-of-registration extension under the same specification, with occupational exposure taken from the panel's ISCO-88-harmonized indices. Country counts differ across waves and outcomes through module coverage and listwise deletion.

[c] A missing-code recode in the registered pipeline also removed respondents aged 77, 88, and 99; the reported estimates correct this and otherwise preserve the registered specification.

Figure 20: Association decomposition and path diagrams, 2016 wave

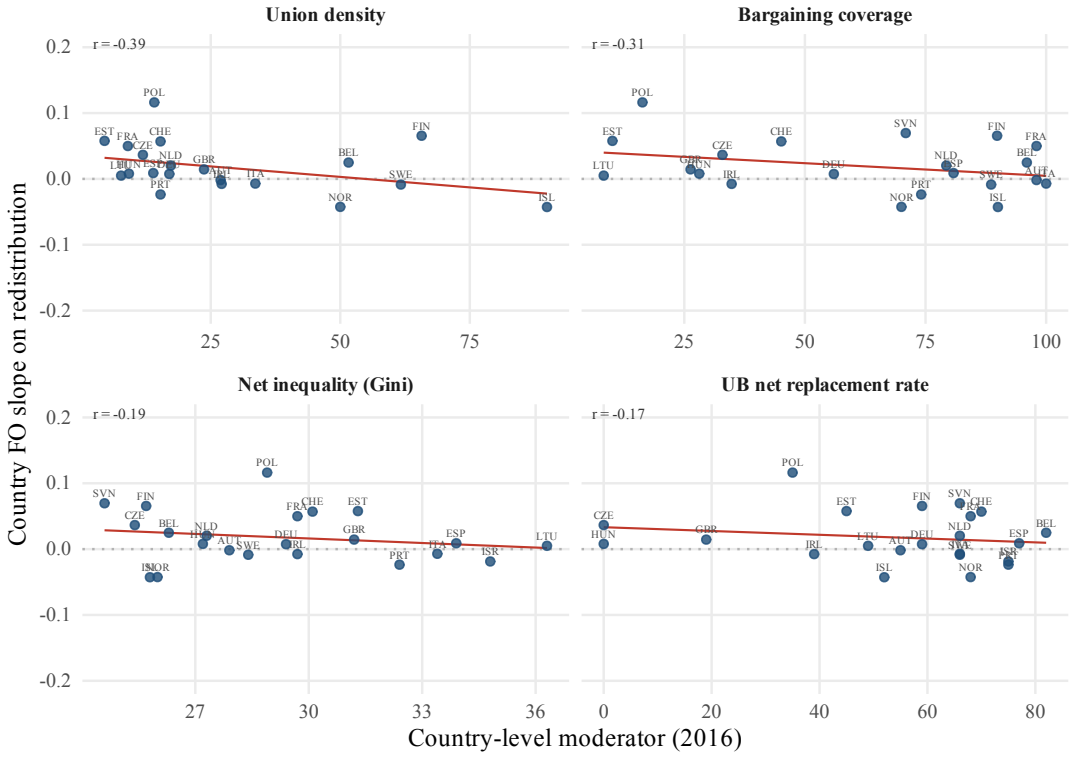

Note: The top panel decomposes the association between exposure and vulnerability into a direct part and indirect parts through each channel. Each of the two outcomes receives its own colour, and filled points mark 95% intervals excluding zero. Additionally, the path diagrams below show the same decomposition, with a and b path coefficients and the implied indirect share per channel, and the one for expected job loss adds contract precarity as a third channel. The top panel's effect axis is fixed at $[-0.02, +0.05]$, shared across mediation figures.

Figure 21: Two-stage institutional diagnostic for redistribution heterogeneity

Note: Each point is a country at the 2016 wave; β_c is that country's fitted Frey–Osborne slope (per SD) from the single model. Line = OLS across countries; r is shown per panel. Effect axis fixed at $[-0.20, +0.20]$, shared across all slope figures.

Table 7: Between- and within-country institutional moderation of the Frey–Osborne automation–redistribution gradient (Mundlak decomposition)

	Between country		Within country			
Moderator	Est.	(SE)	Est.	(SE)	N	Countries
Net inequality (Gini)	-0.0132	(0.0074)	-0.0071*	(0.0023)	185,954	32
Social spending %GDP	-0.0038	(0.0079)	-0.0138***	(0.0025)	181,842	29
Relative redistribution	+0.0056	(0.0074)	+0.0010	(0.0025)	181,680	29
UB net replacement rate	-0.0100	(0.0078)	+0.0052	(0.0027)	179,278	30
Left cabinet share	-0.0039	(0.0071)	+0.0080**	(0.0024)	178,505	29
Union density	-0.0137	(0.0076)	+0.0141***	(0.0028)	150,193	29
Bargaining coverage	-0.0139	(0.0073)	+0.0098**	(0.0030)	149,939	29
Employment protection (EPL)	+0.0038	(0.0082)	-0.0006	(0.0030)	146,207	25
Industry employment share	+0.0045	(0.0080)	+0.0094**	(0.0027)	178,505	29
Trade openness	+0.0080	(0.0067)	-0.0103**	(0.0028)	160,333	29
Benefit earnings-relatedness	+0.0185*	(0.0072)	-0.0049	(0.0026)	179,278	30

Each row is one multilevel model of support for redistribution on standardized Frey–Osborne exposure, following the Mundlak (hybrid) specification: the moderator, lagged one survey year, is split into its country mean (between component) and the deviation from that mean (within component), both standardized, and both interacted with exposure in the same model. Cells report the cross-level interaction coefficients. All models include exposure interactions with contemporaneous unemployment and real GDP growth, the baseline individual controls, year fixed effects, a random exposure slope by country, and a country-year random intercept, with ESS design weights and maximum likelihood estimation. Stars mark Benjamini–Hochberg adjusted p values, corrected across the full family of 44 coefficients (eleven moderators, two components, two exposure indices): * $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$.

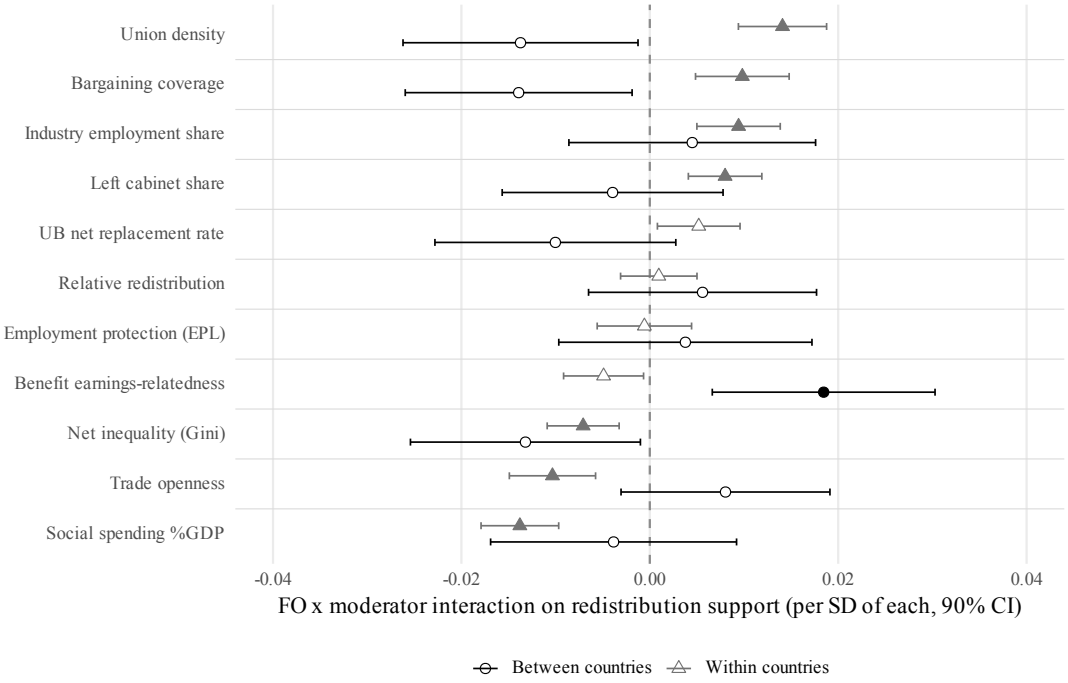

Table 8: RTI robustness: between- and within-country institutional moderation of the automation–redistribution gradient (Mundlak decomposition)

	Between country		Within country			
Moderator	Est.	(SE)	Est.	(SE)	N	Countries
Net inequality (Gini)	-0.0079	(0.0055)	-0.0044	(0.0024)	171,733	32
Social spending %GDP	+0.0037	(0.0058)	-0.0034	(0.0026)	167,929	29
Relative redistribution	+0.0058	(0.0057)	+0.0002	(0.0025)	167,794	29
UB net replacement rate	+0.0082	(0.0058)	+0.0023	(0.0026)	165,518	30
Left cabinet share	+0.0021	(0.0057)	+0.0036	(0.0024)	164,997	29
Union density	-0.0013	(0.0065)	+0.0106**	(0.0029)	139,220	29
Bargaining coverage	+0.0018	(0.0061)	+0.0095**	(0.0030)	139,038	29
Employment protection (EPL)	-0.0029	(0.0068)	-0.0070	(0.0030)	135,299	25
Industry employment share	+0.0037	(0.0061)	+0.0017	(0.0025)	164,997	29
Trade openness	+0.0014	(0.0057)	-0.0087*	(0.0028)	148,474	29
Benefit earnings-relatedness	+0.0019	(0.0060)	-0.0050	(0.0025)	165,518	30

The model and the star rule are those of Table 7, with standardized routine-task-intensity (RTI) exposure in place of Frey–Osborne exposure (* $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$, Benjamini–Hochberg adjusted across the same family of 44 coefficients).

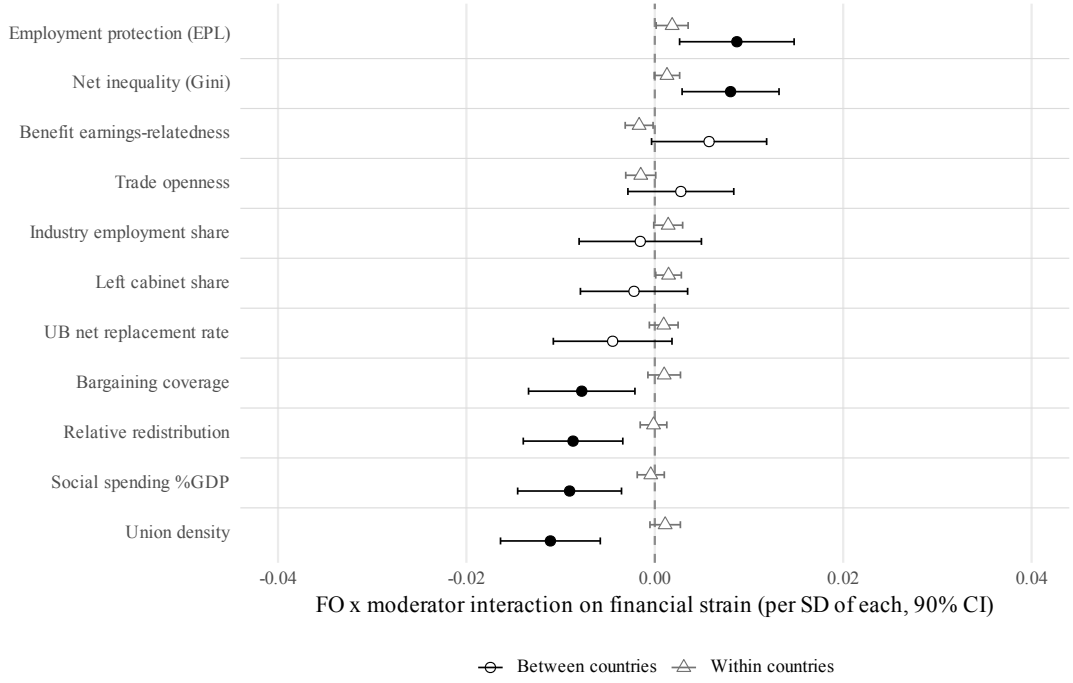

8.3 Institutional Moderation: Full Eleven-Moderator Sweep

Figure 22: Full eleven-moderator sweep, redistribution support

Note: Circles = between-country component (country mean of the lagged moderator); triangles = within-country (deviation from it). Filled symbols are significant at Benjamini–Hochberg $q < 0.10$ within the outcome's family of 44 coefficients. Whiskers are unadjusted 90% CIs, matched to the $q < 0.10$ criterion. Effect axis fixed at $[-0.04, +0.04]$, shared across interaction figures.

Figure 23: Full eleven-moderator sweep, financial strain

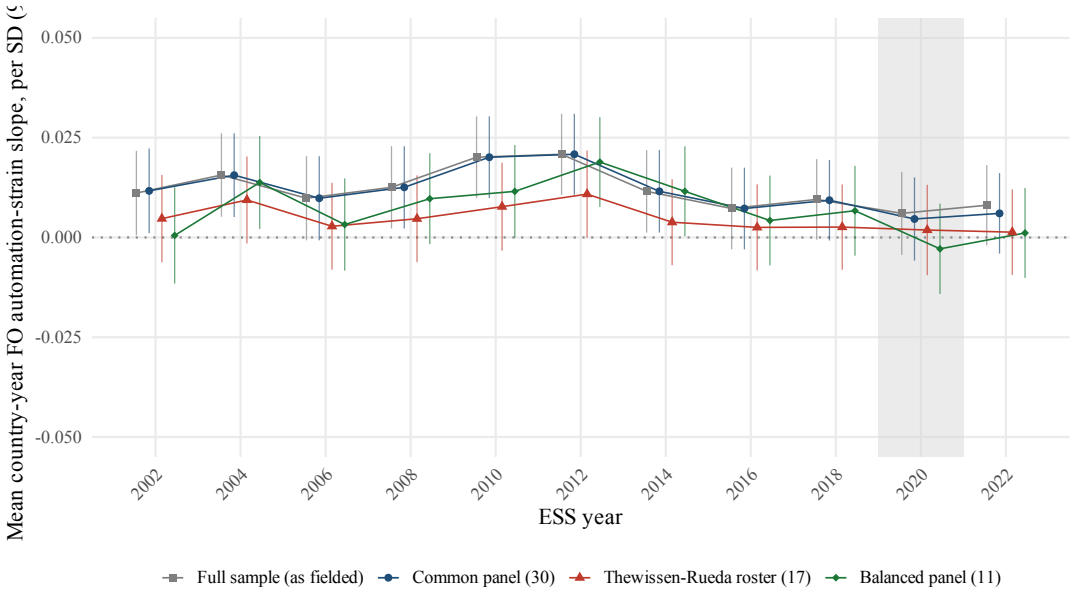

Note: As in the preceding figure.

8.4 Institutional Moderation of the Exposure–Strain Gradient

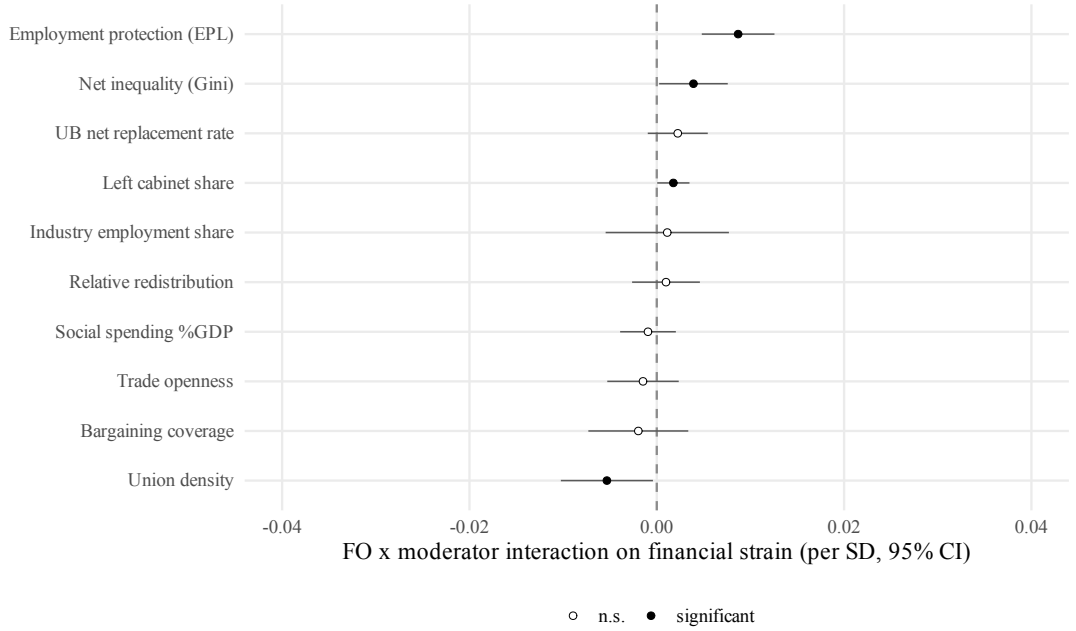

In Figure 24, we repeat the composition exercise of Figure 3 on the same four country rosters, with financial strain as the outcome. The exposure–strain gradient is positive in every wave, significant in six of eleven on the full sample, peaks in 2012, and roughly halves by 2022. All four rosters trace the same path. Thus, the decline is not a product of which countries were fielded. Since the gradient on the Thewissen–Rueda roster is not distinguishable from zero in any wave, the mechanism evidence rests on the wider samples.

Figure 24: Yearly Frey–Osborne automation–financial-strain slopes under four composition assumptions

Note: Series are offset horizontally to avoid overlap, the shaded band marks the 2020 round (ESS10), which COVID disrupted, and the dotted line is at zero. Whiskers are 95% intervals from the fitted slopes. The strain slopes for each country and year are aggregated after estimation as in Figure 3. Effect axis fixed at $[-0.05, +0.05]$, shared across mechanism-outcome slope figures. Because strain slopes run an order of magnitude smaller than redistribution slopes, this range is one quarter of the redistribution range, and the two figures cannot be compared by eye.

Figure 25: Pooled interactions across levels on financial strain

Note: Each point is one lagged moderator's pooled interaction with exposure on financial strain, ordered by estimate (a diagnostic blending the components between and within countries). Filled points mark 95% intervals excluding zero, and the dashed line is at zero. Effect axis fixed at $[-0.04, +0.04]$, shared across interaction figures.

The models in Tables 9 and 10 share the redistribution specification, with financial strain re-

placing support for redistribution in the decomposition between and within countries of equation 5. These linear probability models use design weights, and a coefficient gives the change in the probability of reported strain per standard deviation of exposure per standard deviation of the moderator component. Since being unemployed lies on the path from occupational exposure to felt strain, we leave individual unemployment out of the controls. We calculate the Benjamini–Hochberg adjustment within this family of 44 coefficients, separately from the adjustment in Tables 7 and 8. Read together with those tables, the decomposition separates institutional moderation of the first link of the mechanism, from occupational exposure to felt strain, from institutional moderation of the translation of that strain into redistribution demand.

Table 9: Between- and within-country institutional moderation of the Frey–Osborne automation–financial-strain gradient (Mundlak decomposition)

	Between country		Within country			
Moderator	Est.	(SE)	Est.	(SE)	N	Countries
Net inequality (Gini)	+0.0080	(0.0031)	+0.0013	(0.0008)	186,366	32
Social spending %GDP	-0.0090*	(0.0034)	-0.0004	(0.0009)	182,178	29
Relative redistribution	-0.0087*	(0.0032)	-0.0001	(0.0009)	182,018	29
UB net replacement rate	-0.0045	(0.0038)	+0.0009	(0.0009)	179,615	30
Left cabinet share	-0.0022	(0.0035)	+0.0015	(0.0008)	178,833	29
Union density	-0.0111**	(0.0032)	+0.0011	(0.0010)	150,337	29
Bargaining coverage	-0.0078	(0.0034)	+0.0010	(0.0011)	150,092	29
Employment protection (EPL)	+0.0087	(0.0037)	+0.0018	(0.0010)	146,298	25
Industry employment share	-0.0015	(0.0039)	+0.0014	(0.0009)	178,833	29
Trade openness	+0.0028	(0.0034)	-0.0015	(0.0010)	160,532	29
Benefit earnings-relatedness	+0.0058	(0.0037)	-0.0017	(0.0009)	179,615	30

Each row is one multilevel model of financial strain, a linear probability model, on standardized Frey–Osborne exposure, with the Mundlak decomposition, controls, random effects, design weights and estimation of Table 7. Stars mark Benjamini–Hochberg adjusted p values, corrected across the full family of 44 coefficients (eleven moderators, two components, two exposure indices): $^{*}\,p < 0.05$, $^{**}\,p < 0.01$, $^{***}\,p < 0.001$. Individual unemployment is not among the controls in these models: being unemployed lies on the path from occupational exposure to felt strain, so conditioning on it would block part of the association being measured. The country-level unemployment rate still enters as a level term and as an exposure interaction.

Table 10: RTI robustness: between- and within-country institutional moderation of the automation–financial-strain gradient (Mundlak decomposition)

	Between country		Within country			
Moderator	Est.	(SE)	Est.	(SE)	N	Countries
Net inequality (Gini)	+0.0042	(0.0022)	+0.0006	(0.0009)	172,098	32
Social spending %GDP	-0.0083***	(0.0019)	+0.0004	(0.0009)	168,215	29
Relative redistribution	-0.0066*	(0.0021)	+0.0002	(0.0009)	168,081	29
UB net replacement rate	-0.0013	(0.0025)	+0.0010	(0.0009)	165,805	30
Left cabinet share	-0.0051	(0.0021)	-0.0005	(0.0008)	165,278	29
Union density	-0.0070*	(0.0022)	-0.0002	(0.0010)	139,330	29
Bargaining coverage	-0.0081**	(0.0020)	+0.0009	(0.0010)	139,158	29
Employment protection (EPL)	+0.0023	(0.0022)	+0.0001	(0.0010)	135,356	25
Industry employment share	-0.0030	(0.0025)	+0.0009	(0.0009)	165,278	29
Trade openness	+0.0046	(0.0021)	-0.0011	(0.0010)	148,633	29
Benefit earnings-relatedness	+0.0040	(0.0024)	-0.0021	(0.0009)	165,805	30

The model and the star rule are those of Table 9, with standardized routine-task-intensity (RTI) exposure in place of Frey–Osborne exposure (* $p < 0.05$, ** $p < 0.01$, *** $p < 0.001$, Benjamini–Hochberg adjusted across the same family of 44 coefficients).

8.5 NACE Rev. 2.1: First-Level Economic-Activity Classification

Table 11: Statistical Classification of Economic Activities in the European Community, Rev. 2.1 (NACE Rev. 2.1)

Section	Code Range	Description
A	01:03	Agriculture, Forestry and Fishing
B	05:09	Mining and Quarrying
C	10:33	Manufacturing
D	35:35	Electricity, Gas, Steam and Air Conditioning Supply
E	36:39	Water Supply; Sewerage, Waste Management and Remediation Activities
F	41:43	Construction
G	45:47	Wholesale and Retail Trade
H	49:53	Transportation and Storage
I	55:56	Accommodation and Food Service Activities
J	58:60	Publishing, Broadcasting, and Content Production and Distribution Activities
K	61:63	Telecommunication, Computer Programming, Consulting, Computing Infrastructure and Other Information Service Activities
L	64:66	Financial and Insurance Activities
M	68:68	Real Estate Activities
N	69:75	Professional, Scientific and Technical Activities
O	77:82	Administrative and Support Service Activities
P	84:84	Public Administration and Defence; Compulsory Social Security
Q	85:85	Education
R	86:88	Human Health and Social Work Activities
S	90:93	Arts, Sports and Recreation
T	94:96	Other Service Activities
U	97:98	Activities of Households as Employers and Undifferentiated Goods - and Service-Producing Activities of Households for Own Use
V	99:99	Activities of Extraterritorial Organisations and Bodies

8.6 Standard Occupational Classification (SOC) System

The 2010 Standard Occupational Classification (SOC-2010) is the U.S. statistical system for classifying occupations, which federal agencies use to organize occupational information and labor-market data.

SOC-2010 is hierarchical, ranging from broad groups down to more than 800 specific occupations identified by unique codes.

Major Categories of SOC-2010

The table below lists the SOC-2010 major groups.

Table 12: Major Categories of SOC-2010

Code	Major Group	Code	Major Group
11	Management Occupations	33	Protective Service Occupations
13	Business and Financial Operations Occupations	35	Food Preparation and Serving Related Occupations
15	Computer and Mathematical Occupations	37	Building and Grounds Cleaning and Maintenance Occupations
17	Architecture and Engineering Occupations	39	Personal Care and Service Occupations
19	Life, Physical, and Social Science Occupations	41	Sales and Related Occupations
21	Community and Social Service Occupations	43	Office and Administrative Support Occupations
23	Legal Occupations	45	Farming, Fishing, and Forestry Occupations
25	Education, Training, and Library Occupations	47	Construction and Extraction Occupations
27	Arts, Design, Entertainment, Sports, and Media Occupations	49	Installation, Maintenance, and Repair Occupations
29	Healthcare Practitioners and Technical Occupations	51	Production Occupations
31	Healthcare Support Occupations	53	Transportation and Material Moving Occupations

8.7 Descriptive Statistics

Table 13: Descriptive statistics for the analysis variables of the harmonised 2002–2022 labour-force panel (all eleven ESS waves). Each row is a model variable; the columns report the number of non-missing observations (N), the mean and standard deviation, and the minimum, the tenth, twenty-fifth, fiftieth, seventy-fifth, and ninetieth percentiles, and the maximum. Binary indicators have means equal to their prevalence in the sample. The Frey–Osborne automation probability is on its native 0–1 scale, the routine-task-intensity index on its native GMS scale, and relative equivalized income enters as the within-country-year z-score. The vulnerability items exist only in the waves noted.

Variable	N	Mean	SD	Min	p10	p25	Median	p75	p90	Max
Redistribution support (1–5) (`y`)	259,144	3.83	1.05	1.00	2.00	3.00	4.00	5.00	5.00	5.00
Frey–Osborne automation probability (`fo`)	245,627	0.50	0.34	0.00	0.04	0.13	0.57	0.81	0.95	0.99
Routine-task intensity (GMS) (`rti`)	227,022	-0.14	0.95	-1.52	-1.00	-0.73	-0.44	0.05	1.41	2.24
Relative equivalized income (z) (`income`)	204,967	0.21	1.06	-21.31	-0.79	-0.45	-0.02	0.61	1.54	24.39
Years of education (`eduyrs`)	260,004	13.65	3.75	0.00	9.00	12.00	13.00	16.00	18.00	56.00
Age (`age`)	261,108	42.86	12.27	14.00	26.00	33.00	43.00	52.00	59.00	114.00
Male (`male`)	262,217	0.52	0.50	0.00	0.00	0.00	1.00	1.00	1.00	1.00
Union member (current/former) (`union`)	259,973	0.41	0.49	0.00	0.00	0.00	0.00	1.00	1.00	1.00
Religiosity (0–10) (`relig`)	260,079	4.30	2.98	0.00	0.00	2.00	5.00	7.00	8.00	10.00
Unemployed (active) (`unemp`)	262,341	0.07	0.26	0.00	0.00	0.00	0.00	0.00	0.00	1.00
Financial strain (difficult on income) (`d_fin_strain`)	258,505	0.21	0.41	0.00	0.00	0.00	0.00	0.00	1.00	1.00
Expects job loss (2008, 2016) (`d_job_vulnr`)	47,674	0.25	0.43	0.00	0.00	0.00	0.00	0.00	1.00	1.00
Expects insufficient income (2008, 2016) (`d_income_vulnr`)	47,306	0.27	0.44	0.00	0.00	0.00	0.00	1.00	1.00	1.00
Job not secure (2004, 2010) (`d_job_insecure`)	36,525	0.36	0.48	0.00	0.00	0.00	0.00	1.00	1.00	1.00
Occupational unemployment risk (`occ_risk`)	254,492	0.06	0.05	0.00	0.02	0.03	0.05	0.08	0.12	1.00
Temporary or no contract (`no_or_limtd_contract`)	204,310	0.21	0.41	0.00	0.00	0.00	0.00	0.00	1.00	1.00

8.8 ESS Variable Dictionary

Table 14: ESS variable dictionary

Variable	Description	Value labels
`y`	Redistribution preference; the ESS item gincdif reverse-coded (y = 6 - gincdif) so higher values mean stronger support for the government reducing income differences.	'5' = 'Agree strongly'; '4' = 'Agree'; '3' = 'Neither agree nor disagree'; '2' = 'Disagree'; '1' = 'Disagree strongly'
`fo`	Frey-Osborne (2017) probability that the respondent's occupation is automatable, matched to the occupation code and harmonized across the ISCO-88 and ISCO-08 waves.	Continuous, 0 to 1
`rti`	Goos-Manning-Salomons routine-task-intensity of the occupation (appendix robustness exposure), harmonized across the ISCO seam.	Continuous; higher is more routine-task-intensive
`income`	Thewissen-Rueda relative equivalized household income, entered as the within country-year z-score. Built from the ESS show-card income band midpoint (Pareto mean for the open top band), square-root household equivalization, and the ratio to the design-weighted country-year mean.	Continuous z-score
`eduyrs`	Years of full-time education completed (ESS eduyrs).	Continuous, years
`male`	Respondent gender, from ESS gndr.	'1' = 'Male'; '0' = 'Female'
`age`	Age of the respondent in years (ESS agea).	Continuous, years
`union`	Trade-union membership, from ESS mbtru.	'1' = 'Member, current or former'; '0' = 'Never a member'
`relig`	Subjective religiosity on the ESS rlgdgr scale.	'0' = 'Not at all religious'; '10' = 'Very religious'
`unemp`	Unemployed under the Thewissen-Rueda labour-force definition (ESS mnactic coded as unemployed, looking or not looking for work).	'1' = 'Unemployed'; '0' = 'Employed'

Continued on next page

Variable	Description	Value labels
occ_risk	Occupational unemployment risk, Rehm-style: the design-weighted, leave-one-out unemployment rate by wave and two-digit ISCO under the ILO labour-force definition (minimum cell size of 30).	Continuous, share unemployed
no_or_limtd_contract	Contract precarity, from ESS wrkctra.	'1' = 'Limited-duration or no contract'; '0' = 'Unlimited contract'
d_fin_strain	Subjective financial strain, from ESS hincfel; available in all eleven waves.	'1' = 'Difficult or very difficult on present income'; '0' = 'Coping or living comfortably'
d_job_vulnr	Expected job loss, from ESS lkuemp (likely or very likely to become unemployed in the next twelve months). Welfare module, 2008 and 2016.	'1' = 'Likely or very likely'; '0' = 'Not or not very likely'
d_income_vulnr	Expected income insufficiency, from ESS lknemny (likely or very likely to have insufficient household income in the next twelve months). Welfare module, 2008 and 2016.	'1' = 'Likely or very likely'; '0' = 'Not or not very likely'
d_job_insecure	Job insecurity, from ESS jbscr (rates own job security low). Work module, 2004 and 2010.	'1' = 'Insecure'; '0' = 'Secure'
dweight	ESS design weight, applied in all estimation.	Continuous weight
country	ESS country of interview (39 countries, ISO codes).	Categorical
year	ESS survey year and wave, 2002 to 2022 (rounds 1 to 11).	Categorical, 2002 to 2022

8.9 Institutional Measures Dictionary

Table 15 defines each institutional moderator and records its source series and country coverage.

Table 15: Institutional moderators: definitions and sources

Variable	Measure	Description	Source	Ctries
gininet	Net inequality (Gini)	Gini index of net (post-tax, post-transfer) income inequality, in Gini points.	SWIID, version 9.92	32
relred	Relative redistribution	Reduction of market-income inequality achieved by taxes and transfers, as recorded in the SWIID relative-redistribution series (percent).	SWIID, version 9.92	29
socgdp	Social spending %GDP	Public social expenditure as a share of GDP (percent).	OECD SOCX	29
nrr_m6	UB net replacement rate	Net unemployment-benefit replacement rate for a single person without children at 67% of the average wage, six months into unemployment, without social-assistance top-ups (percent).	OECD tax-benefit models	30
nrr_decay_m6	Benefit earnings-relatedness	Decay of the net replacement rate as previous earnings rise: NRR at 100% of the average wage minus NRR at 67%, six months into unemployment (percentage points). Values near zero indicate earnings-related benefits; strongly negative values indicate flat or capped benefits.	OECD tax-benefit models	30
ud_ipol	Union density	Union density, interpolated from the OECD/AIAS ICTWSS series (percent of employees).	CPDS (OECD/AIAS ICTWSS)	29
adjcov_ipol	Bargaining coverage	Adjusted collective-bargaining coverage, interpolated from the OECD/AIAS ICTWSS series (percent of employees).	CPDS (OECD/AIAS ICTWSS)	29
emprot_reg	Employment protection (EPL)	Strictness of employment protection for regular contracts (index), per the CPDS series emprot_reg.	CPDS	25
gov_left1	Left cabinet share	Share of cabinet posts held by left parties (percent), per the CPDS series gov_left1.	CPDS	29
emp_ind	Industry employment share	Employment in industry, per the CPDS series emp_ind.	CPDS	29
openc	Trade openness	Trade openness: exports plus imports as a share of GDP (percent), per the CPDS series openc.	CPDS	29

Ctries: national clusters available to the moderation models, from the estimation output. Moderators enter the models standardized and lagged one survey year. CPDS: Comparative Political Data Set (Armingeon et al., 2025). SWIID: Standardized World Income Inequality Database.

8.10 Alternative Explanations and Individual-Level Correlations

Table 16 refits the baseline gradient model adding one rival explanation at a time, following the architecture of Thewissen and Rueda (2019). With no pairwise correlation among the rivals above $|0.5|$ (Table 17) and no variance inflation factor above 5, we enter them simultaneously in the final row, reverting to one at a time if either bound is crossed. Because exposure is a score assigned to occupations, adding occupation dummies changes the estimand instead of adding a rival explanation. After absorbing groups at the first digit, we identify the coefficient from residual variation across detailed occupations within those groups, where it turns negative. Hence, the gradient the paper studies is carried by differences between major occupational groups.

Table 16: The exposure gradient under one rival explanation at a time

	Frey–Osborne		RTI	
Added rival	Exposure coef.	(SE)	Exposure coef.	(SE)
Baseline (none)	0.029	(0.008)	0.018	(0.006)
Left-right self-placement	0.031	(0.007)	0.018	(0.006)
Occupational unemployment risk	0.010	(0.008)	0.006	(0.006)
Temporary or no contract	0.029	(0.008)	0.018	(0.006)
Household size	0.028	(0.008)	0.017	(0.006)
One-digit occupation dummies	-0.020	(0.008)	-0.008	(0.008)
All rivals simultaneously	0.013	(0.007)	0.008	(0.005)

Each row refits the baseline gradient model with one rival added; the coefficient shown is on standardized exposure. Common complete-case sample per index ($N = 138,287$ FO, $N = 127,783$ RTI), year fixed effects, random exposure slope by country, country-year intercept. Rivals enter together in the final row only because no rival pairwise correlation exceeds $|0.5|$ and no variance-inflation factor exceeds 5; occupation dummies stay one at a time because exposure is an occupation-level score, so they change the estimand to within-occupation.

Table 17: Individual-level correlations of exposure and the rival explanations

	(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)
(1) FO exposure									
(2) RTI exposure	0.60								
(3) Left-right (0-10)	0.01	-0.03							
(4) Relative income	-0.22	-0.13	0.07						
(5) Education (years)	-0.37	-0.17	-0.03	0.26					
(6) Occ. unemployment risk	0.48	0.26	-0.01	-0.22	-0.34				
(7) Temporary/no contract	0.07	0.02	-0.02	-0.14	-0.06	0.15			
(8) Financial strain	0.15	0.07	-0.03	-0.26	-0.19	0.21	0.14		
(9) Redistribution support	0.10	0.07	-0.19	-0.15	-0.12	0.11	0.05	0.15	

Pairwise complete observations on the harmonized panel; lower triangle shown.

8.11 Full Regression Tables

Models appear as columns within a specification family. Every multilevel model estimates year dummies, which the tables mark with a row instead of printing them. Continuous moderators and exposure indices are standardized, so coefficients are per standard deviation.

Coefficients with standard errors in parentheses. $^{*}p < 0.05$, $^{**}p < 0.01$, $^{***}p < 0.001$, from the normal approximation for the multilevel fits; these are unadjusted p-values, and the Benjamini–Hochberg adjustment reported in the body tables applies to the focal interactions not printed. Random-effects rows are standard deviations.
