A.1 Data collection and experiment procedures

Opinion Box recruits participants for online surveys. Its pool in Brazil exceeds a million people who have said they are willing to take surveys. We recruited a convenience sample directly through the platform, restricted to participants over 18 living in Brazil who speak Portuguese, and directed them to a survey via Qualtrics.

In wave 1, 1,004 participants completed a survey. It covered demographics (age, gender, education, race, residency); the 12-item Buss–Perry trait-aggression measure; voter turnout and vote choice in the most recent presidential election; political interest; feelings towards the PT, Lula, the PL, and Bolsonaro; trust in the police and institutions (President, Congress, Judiciary); satisfaction with democracy; and crime victimization. In wave 2 (about a week later), 624 participants were randomized into one of two vignette conditions, then answered the same trust and satisfaction items again plus four procedural-justice items. Table A4 gives both vignette texts in English translation. Table A5 gives the wording and response codes of each survey item.

TABLE A4. Vignette texts (English translation).

Violent policing vignette	Non-violent policing vignette
You will read a summarized news article about a recent interaction involving the police. For anonymity purposes, the source, location, and the police department details are omitted, and people's names are altered.	*You will read a summarized news article about a recent interaction involving the police. For anonymity purposes, the source, the location, and the police department details are omitted, and people's names are altered.*
According to the news report, a middle-aged man named Carlos was driving home from work when two police officers pulled him over. Carlos was slow in responding to the officers' commands, and when asked for his identification, he could not find it. The officers asked Carlos to step out of the car and kneel on the ground. Despite appearing nervous, Carlos complied with their orders.	According to the news report, a middle-aged man named Carlos was driving home from work when two police officers pulled him over. Carlos was slow in responding to the officers' commands, and when asked for his identification, he could not find it. The officers asked Carlos to step out of the car. Despite appearing nervous, Carlos complied with their orders.
Carlos then began to argue with the officers, asking them to explain the reason for the traffic stop. In response, one of the officers drew his weapon and aimed it at Carlos. Carlos panicked and started running away from the officers. One of the officers chased after him and fired his gun, striking Carlos in the leg. Carlos fell to the ground, was gravely injured, and was taken to the hospital. He underwent surgery and remained in the hospital for several weeks.	Carlos then began to argue with the officers, asking them to explain the reason for the traffic stop. As Carlos continued to discuss with the officers, one of them gently asked him to look for his identification in his car. After ten minutes of searching, Carlos was able to find it. According to Carlos's testimony, he had a rough week, and that is why he was agitated.

TABLE A5. Variable dictionary: question wording and response codes.

Variable	Question wording	Response codes
age	How old are you?	1=18–24 years, 2=25–34 years, 3=35–44 years, 4=45–54 years, 5=55–64 years, 6=65–74 years, 7=75 years or more
gender	What is your gender: male, female or other?	1=Male/male, 2=Female/female
educ	What is the highest level of education you have achieved?	1=I did not attend school, 2=Incomplete primary education, 3=Complete primary education, 4=Incomplete secondary education, 5=Complete secondary education, 6=Incomplete university education, 7=Complete university education
race	Do you consider yourself a white, black, brown, indigenous or yellow person?	1=Asian, 2=White, 3=Indigenous, 4=Other, 5=Brown, 6=Black
traitaggr_q1	For each of the following statements, indicate whether the statement is true or false for you. — "I have difficulty controlling my temper."	1=Completely false, 2=Mostly false, 3=Slightly false, 4=Slightly true, 5=Mostly true, 6=Completely true
traitaggr_q2	For each of the following statements, indicate whether the statement is true or false for you. — "Sometimes I lose control for no good reason."	1=Completely false, 2=Mostly false, 3=Slightly false, 4=Slightly true, 5=Mostly true, 6=Completely true
traitaggr_q3	For each of the following statements, indicate whether the statement is true or false for you. — "I get irritated quickly, but I get over it quickly."	1=Completely false, 2=Mostly false, 3=Slightly false, 4=Slightly true, 5=Mostly true, 6=Completely true
traitaggr_q4	For each of the following statements, indicate whether the statement is true or false for you. — "Sometimes I feel like life is unfair to me."	1=Completely false, 2=Mostly false, 3=Slightly false, 4=Slightly true, 5=Mostly true, 6=Completely true

Continued on next page.

Table A5 continued.

Variable	Question wording	Response codes
traitaggr_q5	For each of the following statements, indicate whether the statement is true or false for you. — "It seems like other people are always luckier."	1=Completely false, 2=Mostly false, 3=Slightly false, 4=Slightly true, 5=Mostly true, 6=Completely true
traitaggr_q6	For each of the following statements, indicate whether the statement is true or false for you. — "I wonder why I sometimes feel so bitter about things."	1=Completely false, 2=Mostly false, 3=Slightly false, 4=Slightly true, 5=Mostly true, 6=Completely true
traitaggr_q7	For each of the following statements, indicate whether the statement is true or false for you. — "There are people who pressured me so much that we even physically attacked each other."	1=Completely false, 2=Mostly false, 3=Slightly false, 4=Slightly true, 5=Mostly true, 6=Completely true
traitaggr_q8	For each of the following statements, indicate whether the statement is true or false for you. — "If there is enough provocation, I am capable of hitting a person."	1=Completely false, 2=Mostly false, 3=Slightly false, 4=Slightly true, 5=Mostly true, 6=Completely true
traitaggr_q9	For each of the following statements, indicate whether the statement is true or false for you. — "I threatened people I know."	1=Completely false, 2=Mostly false, 3=Slightly false, 4=Slightly true, 5=Mostly true, 6=Completely true
traitaggr_q10	For each of the following statements, indicate whether the statement is true or false for you. — "Often, when I realize it, I'm disagreeing with people."	1=Completely false, 2=Mostly false, 3=Slightly false, 4=Slightly true, 5=Mostly true, 6=Completely true
traitaggr_q11	For each of the following statements, indicate whether the statement is true or false for you. — "I can't avoid arguments when people disagree with me."	1=Completely false, 2=Mostly false, 3=Slightly false, 4=Slightly true, 5=Mostly true, 6=Completely true
traitaggr_q12	For each of the following statements, indicate whether the statement is true or false for you. — "My friends say I'm a bit confrontational."	1=Completely false, 2=Mostly false, 3=Slightly false, 4=Slightly true, 5=Mostly true, 6=Completely true
turnout22	Did you vote in the second round of the last presidential election, in 2022?	1=No, 2=I don't remember, 3=Yes

Continued on next page.

Table A5 continued.

Variable	Question wording	Response codes
votechoice22	Who did you vote for?	1=Jair Messias Bolsonaro, 2=Luiz Inácio Lula da Silva, 3=Null/Blank
political_interest	What is your level of interest in politics? Would you say you are very interested, interested, somewhat interested, or not at all interested?	1=Not at all interested, 2=A little interested, 3=Interested, 4=Very interested
pl_feeling	Which of the following sentences best describes your feelings towards the PL (Liberal Party)?	1=I hate the PL, 2=I don't like the PL, but I don't hate it, 3=I neither like nor dislike the PL, 4=I like it, but I don't feel like a PL supporter, 5=I'm a PL supporter
pt_feeling	Which of the following sentences best describes your feelings towards the PT (Workers' Party)?	1=I hate the PT, 2=I don't like the PT, but I don't hate it, 3=I neither like nor dislike the PT, 4=I like it, but I don't feel like a petista (PT supporter), 5=I'm a petista (PT supporter)
lula_feeling	Which of the following sentences best describes your feelings towards Luiz Inácio Lula de Silva?	1=I hate Lula, 2=I don't like Lula, but I don't hate him, 3=I neither like nor dislike Lula, 4=I like Lula, but I don't feel like a Lulist, 5=I like Lula a lot, I am a Lulista
bolso_feeling	Which of the following sentences best describes your feelings towards Jair Messias Bolsonaro?	1=I hate Bolsonaro, 2=I don't like Bolsonaro, but I don't hate him, 3=I neither like nor dislike Bolsonaro, 4=I like Bolsonaro, but I don't feel like a Bolsonarista, 5=I really like Bolsonaro, I am a Bolsonarista
trust_police_w1	For each of the following institutions, indicate whether you believe them to be very trustworthy, moderately trustworthy, somewhat trustworthy, or not at all trustworthy. — Police	1=Not at all trustworthy, 2=Slightly trustworthy, 3=Moderately trustworthy, 4=Very trustworthy
trust_president_w1	For each of the following institutions, indicate whether you believe them to be very trustworthy, moderately trustworthy, somewhat trustworthy, or not at all trustworthy. — President	1=Not at all trustworthy, 2=Slightly trustworthy, 3=Moderately trustworthy, 4=Very trustworthy

Continued on next page.

Table A5 continued.

Variable	Question wording	Response codes
trust_congress_w1	For each of the following institutions, indicate whether you believe them to be very trustworthy, moderately trustworthy, somewhat trustworthy, or not at all trustworthy. — National Congress	1=Not at all trustworthy, 2=Slightly trustworthy, 3=Moderately trustworthy, 4=Very trustworthy
trust_judiciary_w1	For each of the following institutions, indicate whether you believe them to be very trustworthy, moderately trustworthy, somewhat trustworthy, or not at all trustworthy. — The Judiciary	1=Not at all trustworthy, 2=Slightly trustworthy, 3=Moderately trustworthy, 4=Very trustworthy
satisf_democ_w1	In general, are you very satisfied, a little satisfied, Slightly satisfied or not at all satisfied with the functioning of democracy in Brazil?	1=Not at all satisfied, 2=Slightly satisfied, 3=Somewhat satisfied, 4=Very satisfied
crime_vic	Now, changing the subject, have you been the victim of any type of crime in the last 12 months? In other words, have you been a victim of aggression, robbery, kidnapping, fraud, blackmail, extortion, violent threats or any other type of crime in the last 12 months?	1=No, 2=Yes
procjust_dignity	To what extent do you believe Carlos was treated with dignity and respect by the officers during the interaction?	1=Not at all, 2=A little, 3=Moderately, 4=Very much, 5=Completely
procjust_voice	In your opinion, to what extent do you believe Carlos had the opportunity to express his views and concerns during his interaction with the police officers?	1=Not at all, 2=A little, 3=Moderately, 4=Very much, 5=Completely
procjust_impartial	Based on the information provided, to what extent do you believe the decision-making process of the officers involved in the interaction with Carlos was impartial and transparent?	1=Not at all, 2=A little, 3=Moderately, 4=Very much, 5=Completely
procjust_goodintent	How well-intentioned do you believe the officers were during their interaction with Carlos?	1=Not at all, 2=A little, 3=Moderately, 4=Very much, 5=Completely

Continued on next page.

Table A5 continued.

Variable	Question wording	Response codes
trust_police_w2	For each of the following institutions, indicate whether you believe them to be very trustworthy, moderately trustworthy, somewhat trustworthy, or not at all trustworthy. — Police	1=Not at all trustworthy, 2=Slightly trustworthy, 3=Moderately trustworthy, 4=Very trustworthy
trust_president_w2	For each of the following institutions, indicate whether you believe them to be very trustworthy, moderately trustworthy, somewhat trustworthy, or not at all trustworthy. — President	1=Not at all trustworthy, 2=Slightly trustworthy, 3=Moderately trustworthy, 4=Very trustworthy
trust_congress_w2	For each of the following institutions, indicate whether you believe them to be very trustworthy, moderately trustworthy, somewhat trustworthy, or not at all trustworthy. — National Congress	1=Not at all trustworthy, 2=Slightly trustworthy, 3=Moderately trustworthy, 4=Very trustworthy
trust_judiciary_w2	For each of the following institutions, indicate whether you believe them to be very trustworthy, moderately trustworthy, somewhat trustworthy, or not at all trustworthy. — The Judiciary	1=Not at all trustworthy, 2=Slightly trustworthy, 3=Moderately trustworthy, 4=Very trustworthy
satisf_democ_w2	In general, are you very satisfied, Slightly satisfied or not at all satisfied with the way democracy works in Brazil?	1=Not at all satisfied, 2=Slightly satisfied, 3=Somewhat satisfied, 4=Very satisfied

Note: Question wording translated from the Portuguese instrument.

A.2 Scale validation

The *Attachment to the PT scale* adds the five-point items on the PT and on Lula, each rescaled to run from 0 to 1, and rescales the sum to the same range. Respondents pick the sentence that best describes how they feel, with the PT item running from "I hate the PT" to "I am a petista." Since these items are not feeling thermometers, we treat them as ordinal in the polychoric correlations of Tables A6 and A7. For the *Political Trust scale*, we average trust in Congress, the Presidency, and the Judiciary. The *Trait Aggression scale* is the twelve-item Buss–Perry Aggression Questionnaire (Buss and Perry, 1992). Ordinal alpha, computed on each scale's polychoric correlation matrix, is 0.83 for political trust (three items), 0.92 for attachment to the PT (two items), 0.81 for the four feelings items together and 0.89 for trait aggression (twelve items).

TABLE A6. Polychoric correlations among wave-1 partisanship, trust and satisfaction items.

	(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)
(1) Feelings about the PL (rev.)								
(2) Feelings about Bolsonaro (rev.)	0.55							
(3) Feelings about the PT	0.28	0.57						
(4) Feelings about Lula	0.31	0.58	0.84					
(5) Trust in the president	0.28	0.43	0.61	0.62				
(6) Trust in Congress	0.07	0.18	0.32	0.29	0.56			
(7) Trust in the judiciary	0.18	0.33	0.45	0.43	0.64	0.63		
(8) Trust in the police	−0.10	−0.12	−0.03	−0.03	0.15	0.33	0.31	
(9) Satisfaction with democracy	0.28	0.50	0.54	0.55	0.59	0.40	0.56	0.09

Note: Feelings items run from 1 to 5; trust and satisfaction items from 1 to 4. rev.: recoded so that higher values mean colder feelings.

TABLE A7. Polychoric correlations among the 12 Buss–Perry trait-aggression items.

	1	2	3	4	5	6	7	8	9	10	11
Item 1											
Item 2	0.73										
Item 3	0.51	0.50									
Item 4	0.39	0.42	0.46								
Item 5	0.36	0.40	0.37	0.77							
Item 6	0.40	0.45	0.38	0.73	0.71						
Item 7	0.39	0.47	0.28	0.36	0.34	0.38					
Item 8	0.41	0.43	0.30	0.36	0.34	0.37	0.57				
Item 9	0.44	0.52	0.28	0.33	0.31	0.36	0.61	0.51			
Item 10	0.38	0.40	0.41	0.38	0.32	0.36	0.37	0.38	0.38		
Item 11	0.49	0.51	0.39	0.33	0.31	0.34	0.43	0.45	0.46	0.51	
Item 12	0.33	0.33	0.32	0.26	0.22	0.28	0.38	0.32	0.38	0.49	0.47

Note: Item wording in Table A5; responses run from 1 to 6.

A.3 Partisan and charismatic attachments

The main text measures two kinds of attachment: partisan attachment, with a question about the PT, and charismatic attachment, with a question about Bolsonaro. Each main-text grouping uses one question alone: a respondent who answers 1 or 2 is anti, 3 is neutral, and 4 or 5 is pro. We also ask a question of the same form about Lula and the PL, so we can check whether the results depend on how attachment is defined.

We consider three alternative groupings on each side: the two questions together, the other question alone, and the average of the two split at the median (Table A8). We also count respondents as pro if they rate the PT or Lula at 4 or 5, following the wording of H5, and compare respondents who dislike Bolsonaro and like Lula with those who like Bolsonaro and dislike Lula. Every grouping tracks the 2022 vote and the rival leader's rating in the expected direction, the PL answer most weakly (Tables A9 and A10). The pattern reported in the main text holds under other definitions of attachment (Tables A11 and A12). Every grouping on the PT and Lula side gives a larger effect of the violent vignette among respondents attached to the PT or Lula, most clearly for trust in the police, and every grouping on the Bolsonaro and PL side gives a smaller

effect on trust in the police among supporters of Bolsonaro or the PL, with no clear difference in satisfaction with democracy or political trust.

TABLE A8. Coding rules for the political groupings.

Sorting rule	Supporter	Nonpartisan	Opponent
Panel A: The Workers' Party and Lula			
Party only (used)	4 or 5 about the party	3 about the party	1 or 2 about the party
PT and Lula	4 or 5 about both the party and Lula	3 about both the party and Lula	1 or 2 about both the party and Lula
Lula only	4 or 5 about Lula	3 about Lula	1 or 2 about Lula
Median split	above the median	–	at or below the median
PT or Lula	4 or 5 about the party or Lula	3 about both the party and Lula	1 or 2 about the party or Lula
Panel B: Bolsonaro and the PL			
Bolsonaro only (used)	4 or 5 about Bolsonaro	3 about Bolsonaro	1 or 2 about Bolsonaro
Bolsonaro and PL	4 or 5 about both Bolsonaro and the PL	3 about both Bolsonaro and the PL	1 or 2 about both Bolsonaro and the PL
PL only	4 or 5 about the PL	3 about the PL	1 or 2 about the PL
Median split	above the median	–	at or below the median

Note: Each rule reads one or two five-point items, from 1 (*I hate the party*) to 5 (*I am a petista*), worded the same for the PT, the PL, Lula and Bolsonaro. Median splits divide the sum of two items, each rescaled 0–1: the PT and Lula in Panel A, Bolsonaro and the PL in Panel B. –: no nonpartisan group. Unsorted under PT and Lula, whose two answers fall in different groups: 211 of the 1,004 wave-1 respondents (133 of the 624 in both waves); under Bolsonaro and PL, likewise: 429 (277). Unsorted under PT or Lula, being warm about one item and cold about the other: 22 (14).

TABLE A9. Validity checks for the political groupings.

Panel A: Attachment to the PT

	Party only (used)	PT and Lula	Lula only	Median split	PT or Lula
Opponents (%)	47.3	52.1	47.5	–	52.6
Matches own side	0.79	0.94	0.79	circular	0.89
Matches other side	−0.54	−0.62	−0.57	−0.51	−0.56
Ranks voters	0.90	0.95	0.92	0.90	0.92
Predicts vote	0.87	0.92	0.87	0.90	0.90
Vote explained	0.49	0.68	0.57	0.52	0.57
People	744	593	744	744	728

Panel B: Attachment to Bolsonaro

	Bolsonaro (used)	Bolsonaro and PL	PL only	Median split
Opponents (%)	41.9	38.8	30.7	–
Matches own side	0.49	0.94	0.52	circular
Matches other side	−0.55	−0.57	−0.29	−0.43
Ranks voters	0.91	0.93	0.74	0.79
Predicts vote	0.86	0.88	0.70	0.78
Vote explained	0.49	0.55	0.15	0.30
People	744	425	744	744

Note: Codings as in Table A8, applied to the wave-1 ratings. Opponents: percent of the respondents a coding sorts who fall in its opponent group; –: a two-group median split. Matches own side: Pearson correlation with the same-side rating the coding is not built on (Lula, or the PT for Lula only; the PL, or Bolsonaro for PL only); circular: the coding is built from that rating. The two-item codings read it as well. Matches other side: correlation with the rival leader's rating. Three-group codings are scored opponent −1, neutral 0, supporter 1; median splits 1 above the median and 0 otherwise. Ranks voters (AUC), Predicts vote (share correct at a 0.5 cutoff) and Vote explained (McFadden pseudo-R^2) come from a logit of the 2022 vote on the coding alone: a Lula vote in Panel A, a Bolsonaro vote in Panel B, spoilt and missing ballots excluded. People: N in the vote models.

TABLE A10. Correlations of the political groupings with wave-1 attitudes.

	Satisfaction with democracy	Trust in the president
Panel A: Attachment to the PT		
Party only (used)	0.50	0.58
PT and Lula	0.58	0.65
Lula only	0.53	0.59
Median split	0.50	0.57
PT or Lula	0.53	0.60
Panel B: Attachment to Bolsonaro		
Bolsonaro only (used)	−0.48	−0.42
Bolsonaro and PL	−0.52	−0.47
PL only	−0.29	−0.28
Median split	−0.37	−0.35

Note: Pearson correlations between each coding (Table A8) and the wave-1 item, over the respondents the coding sorts: 1,004, except 793 for PT and Lula, 982 for PT or Lula and 575 for Bolsonaro and PL. Three-group codings are scored opponent −1, neutral 0, supporter 1; median splits 1 above the median and 0 otherwise.

Note: Rows with a group size in parentheses (among the 624 respondents in both waves): that group's effect of the violent vignette. Rows "X − Y": the first group's effect minus the second's; its SE accounts for the covariance between the two. *p*: one-tailed (1t) or two-tailed (2t). Codings as in Table A8. Panel E: anti-Bolsonaro pro-Lula rates Bolsonaro 1–2 and Lula 4–5, pro-Bolsonaro anti-Lula the reverse, and neither is everyone else. Outcomes in standard deviations.

A.4 Main results

Tables A1 to A3 report the ATE and CATEs, one table per outcome. Let y_{it} be the standardized outcome of respondent i in wave t, with respondent fixed effects α_i and wave fixed effects γ_t. In column 1, we estimate

$$y_{it} = \alpha_i + \gamma_t + \beta D_{it} + \varepsilon_{it}, \tag{1}$$

where D_{it} is 1 in wave 2 for respondents shown the violent vignette and 0 otherwise. To estimate the conditional effects in columns 2 to 5, we interact D_{it} with one moderator M_i at a time,

$$y_{it} = \alpha_i + \gamma_t + \beta D_{it} + \delta D_{it} M_i + \varepsilon_{it}, \tag{2}$$

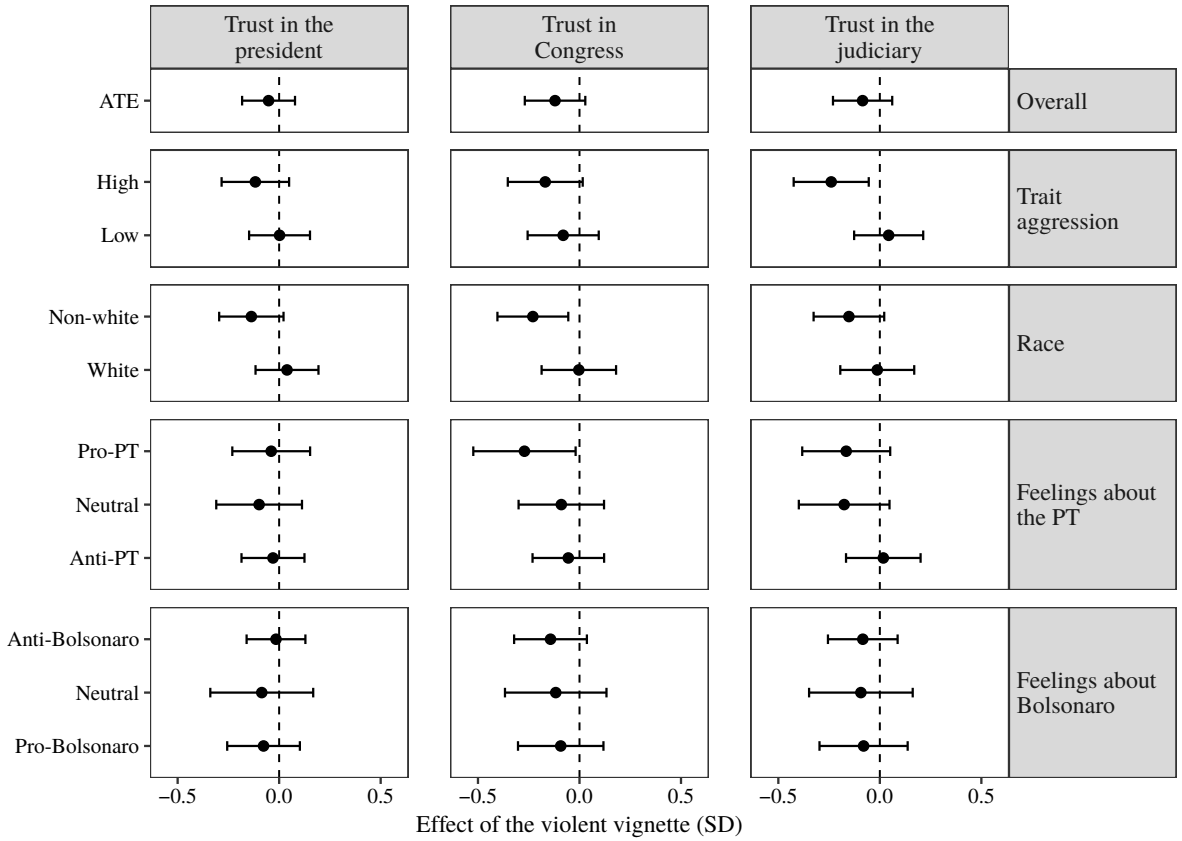

where β gives the effect in the omitted group and δ the difference from it. Note that M_i is constant between waves, so its own term is absorbed by α_i. We include the PT grouping as two indicators, pro-PT and neutral, and the Bolsonaro grouping as two, anti-Bolsonaro and neutral. We cluster standard errors by respondent.

A.4.1 The political trust index, item by item

An average effect on the political trust index can conceal differences in how its items move. Estimated item by item, the average effects are small and move in the same direction, while the differences between groups are larger and fall unevenly across institutions (Figure A1 and Table A13).

We report this as a decomposition, not as a fourth test. These items were not separately hypothesized, and six additional comparisons per moderator raise a multiplicity concern.

FIGURE A1. Average and conditional effects on the three political trust items.

Note: Each column re-estimates the main-text models with one item of the political trust index as the outcome, standardized on its own. PT and Bolsonaro groups as in the main text: pro 4–5, neutral 3, anti 1–2 on each item; omitted groups anti-PT and pro-Bolsonaro. Points: the average effect and each group's own effect; bars: 95% confidence intervals. Estimates in standard deviations.

TABLE A13. Vignette effects on the three political trust items.

Neutral	−0.086	0.129	0.508	−0.117	0.127	0.359	−0.093	0.130	0.473
Pro	−0.077	0.091	0.399	−0.092	0.107	0.389	−0.080	0.111	0.470

Note: Each column re-estimates the main-text models with one item as the outcome, standardized on its own; the estimates are those of Figure A1. Rows "X − Y": the first group's effect minus the second's; its SE accounts for the covariance between the two. *p*: two-tailed. Groups as in Figure A1. Outcomes in standard deviations.

A.5 Who left the panel between waves

We examine the 380 who did not return, as promised in the pre-registration. By wave 2, the 380 had already left the panel, and randomization ran within the 624 who remained. Differences between leavers and stayers in wave 1 cannot bias the estimated effect, although they can change who the estimate describes. Leavers and stayers do not differ in the baseline outcomes, but those who stayed are lower in trait aggression (Table A14), which also predicts the wave-2 outcomes (Table A15), so the estimates by trait aggression describe a less aggressive panel than the sample we recruited.

TABLE A14. Wave-1 characteristics of panel stayers and leavers.

	Mean (left)	Mean (stayed)	SMD	*p*
Age	2.634	2.880	0.18	0.005
Education	5.889	6.053	0.13	0.045
Non-white	0.526	0.506	−0.04	0.541
Woman	0.518	0.503	−0.03	0.640
Political interest	2.429	2.561	0.14	0.037
Attachment to the PT (scale)	0.421	0.409	−0.04	0.515
Trait aggression (scale)	0.348	0.306	−0.19	0.004
Trust in the police	2.611	2.617	0.01	0.912
Trust in the president	2.224	2.224	0.00	0.992
Trust in Congress	2.221	2.189	−0.03	0.595
Trust in the judiciary	2.429	2.385	−0.05	0.487
Satisfaction with democracy	2.182	2.143	−0.04	0.540

Note: Left: N = 380; stayed: N = 624. Means on the wave-1 response codes in Table A5 (age and education are bracket codes); non-white and woman are proportions; the two scales run from 0 to 1. SMD: stayed minus left, in pooled standard deviations. *p*: Welch two-sample *t*-test.

TABLE A15. Attrition screen: wave-1 predictors of leaving and of wave-2 outcomes.

	p (leaving)	Smallest *p* (outcomes)	Threat
Trait aggression (scale)	0.004	0.001	Yes
High trait aggression (above median)	0.006	0.010	Yes
Age	0.007	0.217	No
Race (six categories)	0.034	0.232	No
Political interest	0.038	0.505	No
Education	0.042	0.021	Yes
Feelings about Bolsonaro	0.046	<0.001	Yes
Feelings about Bolsonaro (rev.)	0.046	<0.001	Yes

Note: Rows: wave-1 variables with $p \leq 0.05$ in a likelihood-ratio test from a logit of leaving the panel on the variable alone. Smallest *p*: the minimum over three *F*-tests, one per wave-2 outcome, from OLS of the outcome on the variable, treatment and the wave-1 outcome among stayers. Threat: Yes when that minimum is at or below 0.10. rev.: recoded so that higher values mean colder feelings.

A.6 Ethics and human subjects

This research was reviewed and approved by the (anonymized university) Institutional Review Board, protocol IRB2023-00445, approved September 1, 2023 under expedited review category 7 and modified on September 26–27, 2023, before fieldwork. The IRB approved an alteration of consent for deception and a waiver of documentation of consent under 45 CFR 46.117(c)(1)(i), since consent is the only identifying record. Participants read the full consent form on their screen and, instead of signing their names, clicked "Yes, I agree to participate"; consent was documented by completion of the survey. Subject-facing materials were administered in Portuguese.

The study entails deception. Participants read a fictitious news article about a police encounter, so the consent form omitted some information. The deception is necessary in a vignette experiment. The two scenarios begin the same way and differ in how the police act and what follows, which isolates the effect of that conduct, and if participants knew the scenario was untrue, it would have no effect. Both vignettes describe a routine traffic stop; in the treatment condition the encounter escalates to violence and the driver is shot in the leg. We presented the description as text, without any image. At the end of the survey, participants were fully debriefed: they were informed that the news article they read was fictional, created for the purposes of this study, and about the purpose of the deception. After the debriefing, participants could retract their participation within one month by contacting the principal investigator by e-mail, in which case their data would be removed while they kept their compensation. The recruitment advertisement, consent form and debriefing form were among the materials the IRB approved.

The approved protocol states that the research involves no more than minimal risk and that the alteration of consent does not adversely affect participants' rights or welfare, since no identifiable data are collected. The study shows a depiction of police violence to a Brazilian sample that is roughly half non-white. Participants were compensated by Opinion Box under its standard panel incentive scheme. The research conforms to the APSA Principles and Guidance for Human Subjects Research.

Conflict of interest. None declared.

Funding. This work was supported by (anonymized university).

A.7 Manipulation check and randomization balance

Since they ask how the officers in the vignette treated Carlos, the four procedural-justice items are the most direct manipulation check, and respondents shown the violent vignette rate the officers lower on all four (Table A16). On their wave-1 answers, given before assignment, the two groups do not differ at the 5 percent level on any characteristic (Table A17).

TABLE A16. Manipulation check: wave-2 means by vignette condition.

	Overall	Control	Treated	Diff.	SMD	p
Trust in the police	2.651	2.764	2.540	−0.224	−0.27	<0.001

Procedural justice: good intent	624	2.737	1.245	1	5
Procedural justice: impartiality	624	2.681	1.275	1	5
Procedural justice: voice	624	2.596	1.258	1	5

Note: Response codes as in Table A5; age and education are bracket codes. Non-white, woman and violent vignette are 0/1 indicators.

A.9 Pre-registration materials

A.9.1 Where the analysis departs from the registered plan

The registered analysis plan, reproduced verbatim below, specifies t-tests, Mann-Whitney tests and linear regression, evaluated two-tailed at the 0.05 and 0.01 levels. We instead estimate a panel model with respondent and wave fixed effects.

The registered tests compare group means without using the information collected in both measurements. We can compare each respondent with their own earlier answers, given that every respondent answered the same outcome questions before and after the vignette. Respondent fixed effects absorb anything stable about a person, while wave fixed effects absorb anything that moved all respondents between the two sittings. A comparison between groups using wave-2 answers alone would leave both out. For this reason, we changed the estimator while keeping the registered hypotheses, their predicted directions, and the outcomes.

After the registration, we went deeper into the literature and concluded that, while a deviation, a one-tailed test is technically more appropriate for directional hypotheses (Cho and Abe 2013; Hales 2024). Because our theory is directional, we report the one-tailed p-value wherever it predicts a direction, and the two-tailed value for the Bolsonaro and PL comparisons. Table A19 reports both values for every registered test, and Table A20 lists each departure from the registered plan. The registration also names three moderators, all of which appear in the main text. The additional groupings are exploratory and were not registered. They include attachment to Bolsonaro, which the main text plots and column 5 of Tables A1 to A3 reports, and the alternative partisanship codings and reinforcing-identity comparisons in Section A.3.

We follow the registered exclusion rule as written.

TABLE A19. The registered tests, one-tailed and two-tailed.

	Est.	SE	p (1t)	p (2t)
Panel A: Procedural justice (H1)				
Dignity	−1.309	–	<0.001	<0.001
Good intent	−0.950	–	<0.001	<0.001
Impartiality	−0.965	–	<0.001	<0.001
Voice	−0.710	–	<0.001	<0.001
Panel B: Average effect (H2 to H4)				
Trust in the police (H2)	−0.405	0.089	<0.001	<0.001
Political trust (H3)	−0.099	0.064	0.062	0.124
Satisfaction with democracy (H4)	−0.194	0.061	<0.001	0.001
Panel C: Pro-PT − anti-PT (H5)				
Political trust	−0.154	0.104	0.070	0.141
Satisfaction with democracy	−0.157	0.101	0.060	0.119
Panel D: Non-white − white (H6)				
Political trust	−0.211	0.087	0.008	0.016
Satisfaction with democracy	−0.121	0.082	0.070	0.139
Panel E: High − low trait aggression (H7)				
Political trust	−0.192	0.088	0.015	0.029
Satisfaction with democracy	−0.163	0.083	0.026	0.051

Note: H1: wave-2 difference in means, violent minus non-violent vignette, on the response codes (Table A16); p from the Welch test. H2 to H7: two-way fixed effects estimates in standard deviations (Table A1 to Table A3); for H5 to H7, the difference between the two groups' effects. Every registered direction is negative. p (1t): one-tailed in that direction; p (2t): two-tailed, the registered criterion.

TABLE A20. Departures from the registered plan.

	Registered	Reported
Registration	On OSF, before data collection	Link withheld for anonymous review
Estimator	*t*-tests and Mann–Whitney tests of group means; linear regression with covariates and for the moderators	Two-way fixed effects on both waves (Tables A1 to A3); the wave-2 means in Table A16
Inference	Two-tailed tests at the 0.05 and 0.01 levels	One-tailed where the theory predicts a direction, two-tailed otherwise; both for every registered test in Table A19
Indices	Additive indices on 0–1, validated by confirmatory factor analysis	Political trust: the mean of its three items, standardized, with ordinal alpha and polychoric correlations (Section A.2); procedural justice: its four items one by one
Partisan moderator (H5)	Identifying with Lula or the PT	The PT item in the main text; the Lula and combined codings in Table A11
Sample	1,000 participants, stopping at 1,000	1,004 completed wave 1; the 624 who completed both waves, by the registered exclusion rule; the wave-1-only respondents in Section A.5
Exploratory analyses	None registered	Attachment to Bolsonaro and the alternative partisan codings (Section A.3)

Note: Registered: the plan reproduced in Section A.9.2. Reported: what this paper does.

A.9.2 Study Information

Hypotheses

Based on the experimental design, we will test the following initial set of hypotheses:

- H1: Participants in the treatment condition will be more likely to perceive a lack of procedural fairness in the police encounter compared to those in the control group.
- H2: Participants in the treatment condition will be more likely to say they distrust the police compared to those in the control group.
- H3: Participants in the treatment condition will exhibit lower levels of political trust compared to those in the control group.
- H4: Participants in the treatment condition will exhibit increased dissatisfaction with democracy compared to those in the control group.

Additionally, drawing from theories of social identity, partisanship, and personality, we argue that the effect of making police violence salient on political trust and satisfaction with democracy should be moderated by partisan orientations, racial identity, and trait aggression. We propose the following hypotheses regarding these moderating effects:

- (Moderating effect of partisan orientations) H5: The negative effects of police violence on political trust and satisfaction with democracy will be stronger among participants identifying with Lula or the Workers' Party (PT).

- (Moderating effect of race) H6: The negative effects of police violence on political trust and satisfaction with democracy will be stronger among non-whites.
- (Moderating effect of trait aggression) H7: The negative effects of police violence on political trust and satisfaction with democracy will be stronger among individuals high in trait aggression personality.

Design Plan

Study type. Experiment — a researcher randomly assigns treatments to study subjects; this includes field or lab experiments, also known as an intervention experiment, and includes randomized controlled trials.

Blinding. For studies that involve human subjects, they will not know the treatment group to which they have been assigned.

Study design. The study is a between-subjects experiment with a completely randomized design with one factor having two mutually exclusive conditions.

Randomization. We will use block randomization, where each participant will be randomly assigned to one of the two equally sized, predetermined blocks. We will run the study on Qualtrics software that will perform the randomization as individuals enter the online survey.

Sampling Plan

Existing data. Registration prior to creation of data.

Data collection procedures. Our study design is a between-subjects randomized survey experiment. Subjects will participate by responding to an online survey. Our population of interest is adult Brazilians with access to the internet. The study will be conducted using Opinion Box, an online survey company, entirely online; researchers will not have access to identifying information, and because the study is conducted externally through a Qualtrics link, even anonymous Opinion Box worker IDs cannot be linked to survey responses.

There will be two waves. In wave 1, participants answer demographics, opinions about institutions, satisfaction with democracy, and political positions. In wave 2, the same participants are invited again; those who agree are given a fictional summarized news article about a police interaction. In the treatment, the police act inappropriately, relying disproportionately on physical violence in a routine traffic stop; in the control, the police act appropriately. Every participant is then asked the same questions about the article and about institutions/satisfaction with democracy.

Sample size. Our target sample size is 1,000 participants (500 per treatment condition).

Sample size rationale. The sample size was chosen to match standard sample sizes in comparable political-behavior experiments, generally sufficient for a two-condition design.

Stopping rule. We will stop data collection when we have reached 1,000 total participants.

Variables

Manipulated variables. We manipulate whether the participant is exposed to a vignette describing a traffic stop that turns into excessive police violence (treatment) or one that goes normally without violence (control).

Measured variables. Subjects' responses to survey questions gauging attitudes about the police, political institutions, and satisfaction with democracy, plus demographics and other political attitudes/behaviors measured pretreatment in wave 1.

Indices. The procedural-justice index is an additive index of the four procedural-justice items, normalized to 0–1, validated by a confirmatory factor analysis. Political trust is likewise an additive index of trust in Congress, the executive, and the judiciary, normalized to 0–1 and validated by a confirmatory factor analysis.

Analysis Plan

Statistical models. We will use simple t-tests and non-parametric Mann-Whitney tests to analyze differences in group means, and linear regression when including additional demographic covariates and when studying the conditional effects of the three moderators.

Inference criteria. Two-tailed tests, with significance levels of both 0.05 and 0.01.

Data exclusion. For the main analysis, we include data from subjects who answered both waves. In a supplementary analysis, we analyze wave-1-only respondents.

Missing data. List-wise deletion of missing cases in the relevant analysis.

B Study 2

B.1 Data sources and sample construction

Table B1 describes the funnel employed to construct the analytical sample, the criteria used to define the local exposure to police violence, and the data units and levels used for inference. We first drop respondents that record a change in municipality before 2019. We then remove respondents that did not participate in the 2019 wave of the survey. Finally, we drop respondents in municipalities with no recorded protest in 2009–2018, for which S_c is undefined.

The S_c step drops four municipalities for which S_c cannot be computed. COES recorded no protest event in these four municipalities in any year from 2009 to 2018, so the standard deviation is zero. Two of them also had no recorded protest in 2019; the other two did. The step removes 125 respondents. Only one of the four municipalities has an exposed zone, with four respondents.

The records collected by the INDH provide further details regarding each victim's violence type, instrument, and consequences for each victim and episode of the registry. Table B2 provides an aggregate summary of these episodes of police violence. Among victims of police violence, 88.1 percent report physical injuries. The registry also records 153 cases of ocular trauma; 32 resulted in irreversible vision loss. The anti-riot shotgun is the most frequently logged instrument; a gunshot wound is the most frequently logged act.

Figure B1 maps the census zones of the eight no-surge municipalities in Panel D of Table B1, with the INDH registry's georeferenced violence cases as points.

TABLE B1. Sample construction, exposure, covariates, and inference units.

Panel A: Sample construction

Step	Respondent-waves	Respondents	Municipalities
ELSOC panel, waves 1–4, municipality known	12,565	4,447	105
Drop movers (2016–2019 rule)	12,283	4,373	94
Drop respondents not interviewed in 2019	10,591	3,343	94
Drop municipalities with undefined S_c	10,204	3,218	90
Drop missing outcome			
Political trust: low share	10,014	3,212	90
Satisfaction with democracy: not satisfied share	9,776	3,205	90
Police trust: level and low share	10,185	3,218	90
Drop fixed-effect singletons			
Political trust: low share	9,962	3,169	89
Satisfaction with democracy: not satisfied share	9,676	3,114	89
Police trust: level and low share	10,170	3,212	89

Panel B: Treatment and protest strata

Quantity	Count
Respondents in an exposed zone by the interview date	450 (13.5%)
Municipalities with $S_c < 1$ (no protest surge)	18
Municipalities with $S_c \geq 1$ (protest surge)	72

Panel C: Covariates and inference

Quantity	Count
Neighborhood controls (census-zone measures)	6
Respondents missing each control (median-imputed)	5
Census zones (cluster units)	762
Median respondents per zone	4

Panel D: Identifying support where protest did not surge

Zone group	Respondent-waves	Respondents	Zones
Exposed zones	224	72	14
Unexposed zones in the same municipalities	449	138	30

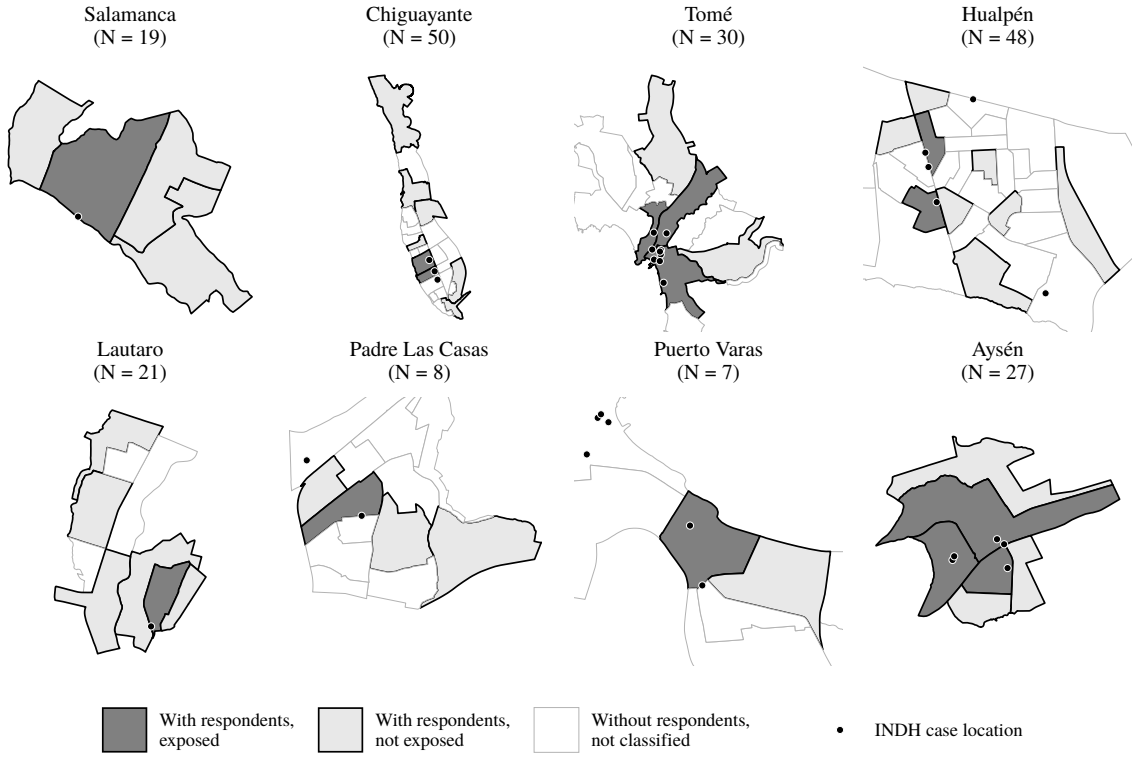

Note: Panel A: each row applies one further screen; outcome rows start from the S_c row. Singletons: respondents with one wave, municipality-waves with one respondent. S_c: a municipality's 2019 protest activity minus its 2009–2018 mean (2011 excluded), in units of its standard deviation over those years. Exposed zone: an INDH-registered event in the respondent's own census zone by the interview date. Panel D: the 8 of 18 municipalities with no protest surge that hold an exposed zone; S_c row.

TABLE B2. Profile of the INDH registry of violations.

Category	N	Percent
Panel A: Consequence (one per victim)		
Physical injuries	2,496	88.1
Other injuries	107	3.8
Injury from ocular trauma	101	3.6
Undetermined	55	1.9
Vision loss from irreversible ocular trauma	32	1.1
Ruptured eyeball	20	0.7
Death	7	0.2
Burns	5	0.2
Other (fewer than 5 each)	9	0.3
Panel B: Violence type recorded (not mutually exclusive)		
Physical violence	2,659	93.9
Other type of violence	1,184	41.8
Sexual violence	390	13.8
Psychological violence	300	10.6
Panel C: Primary instrument (1,484 records logged)		
Anti-riot shotgun	996	67.1
Tear-gas launcher	258	17.4
Pepper spray	55	3.7
Water cannon truck	48	3.2
Other	127	8.6

Note: 2,832 victim records, 17 October 2019 to 14 March 2020. Percent: share of victim records; in Panel C, of the 1,484 records that log an instrument. Categories translated from the registry's Spanish labels. Source: Instituto Nacional de Derechos Humanos (2020).

FIGURE B1. Exposed and unexposed census zones in the eight no-surge municipalities.

Note: 2017 INE urban census zones of the 8 no-surge municipalities that hold an exposed zone. Exposed: an INDH case dated by the interview lies inside the zone. Points: INDH-registered case locations, 19 October 2019 to 10 March 2020 (32 locations). Each panel shows only the urban census zones around the municipality's sample zones, not its full territory; panels are not to a common scale. N: respondents of the core analysis panel in the municipality.

B.1.1 Protest-intensity statistic (S_c) construction

The third difference uses S_c, which measures 2019 protest intensity for each municipality in units of its own pre-period standard deviation:

$$S_c = \frac{n_{2019} - \bar{n}_{\text{pre}}}{sd_{\text{pre}}}.$$

Here n is the number of a municipality's COES-recorded protest events in a year. The pre-period runs from 2009 to 2018, excluding 2011, since that year's student movement put 44 of the 90 municipalities' event counts above their pre-period mean. In Table B3, we report the event counts and the distribution of S_c across the 90 of the panel's 94 municipalities where it can be calculated.

TABLE B3. Construction of the protest-intensity statistic S_c.

Quantity	Value
Panel A: COES events, 2009–2019	
Events (municipality-year screen)	21,151
In the pre-period (2009–2018, 2011 excluded)	16,169
In 2019	4,982
Panel B: S_c across the panel's 94 municipalities	
Municipalities with a usable pre-period series	90
Below their historical norm ($S_c < 1$)	18 (20.0%)
Elevated ($S_c \geq 1$)	72 (80.0%)
No usable pre-period series (S_c undefined)	4
S_c: 25th / 50th / 75th percentile	1.47 / 3.23 / 6.18
Panel C: S_c formula by year: 25th / 50th / 75th percentile	
2016	−0.51 / 0.00 / 0.98
2017	−0.60 / −0.11 / 1.01
2018	−0.52 / −0.02 / 0.60
2019	1.47 / 3.23 / 6.18

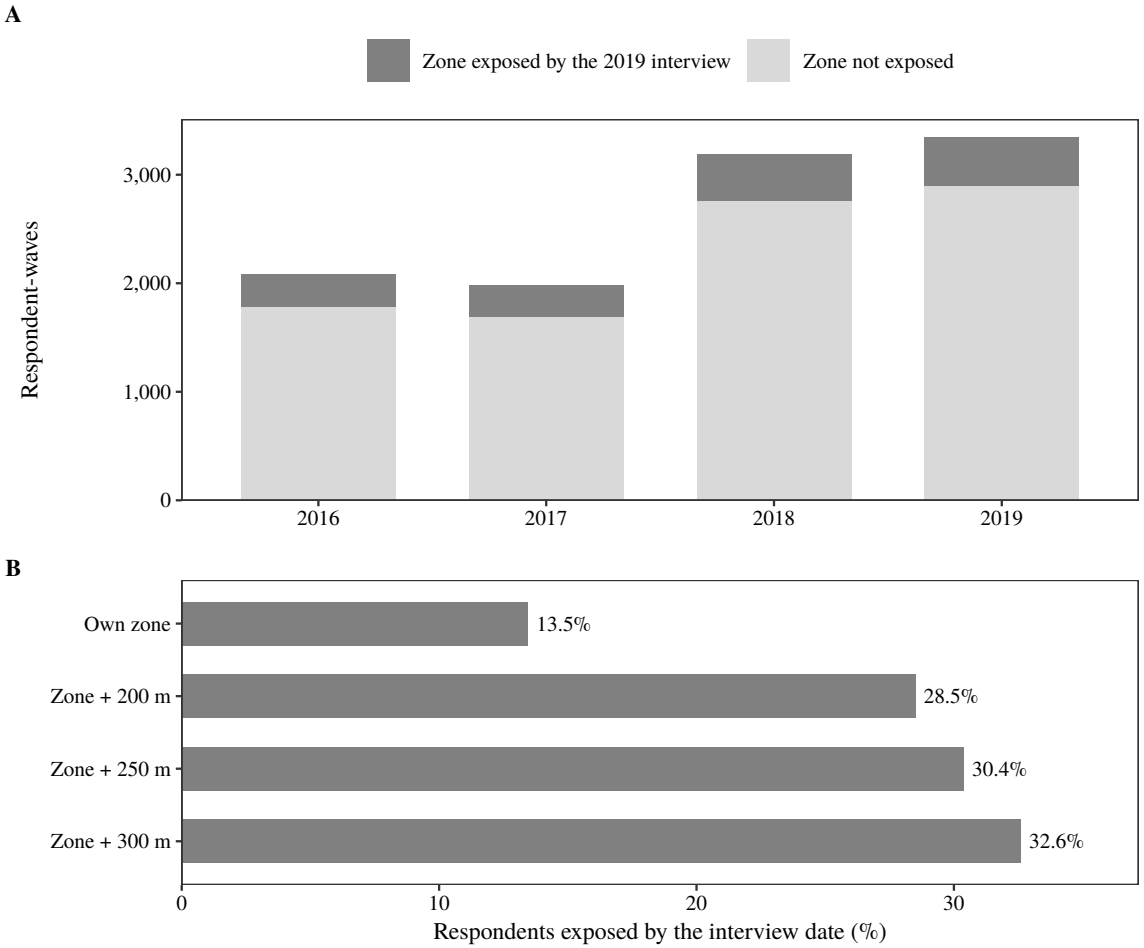

Note: Protest activity: COES events in a municipality-year. Percentages are shares of the 90 municipalities with S_c defined in Panel B. S_c is undefined where a municipality's pre-period standard deviation is zero. Panel C applies the S_c formula to each year's protest activity, with the same pre-period mean and standard deviation, over the same 90 municipalities; the 2019 row is S_c.

B.1.2 Sample and exposure by wave

We treat ELSOC's nonresponse codes (−999 and −888) as missing.

A respondent's exposure is fixed by their zone and the 2019 interview date, so the darker bars of Figure B2 in 2016–2018 count respondents in zones that were exposed later. Since all were unexposed before 2019, placebo results answer whether zones that would later be exposed were already differing from those never exposed.

FIGURE B2. Sample construction and exposure.

Note: Panel A: respondent-waves by ELSOC wave, split by whether the respondent's zone is exposed by the 2019 interview. Panel B: share of respondents exposed under each definition, counted once per respondent. Zone + r m: an event dated by the interview lies in the respondent's zone or within r m of its boundary.

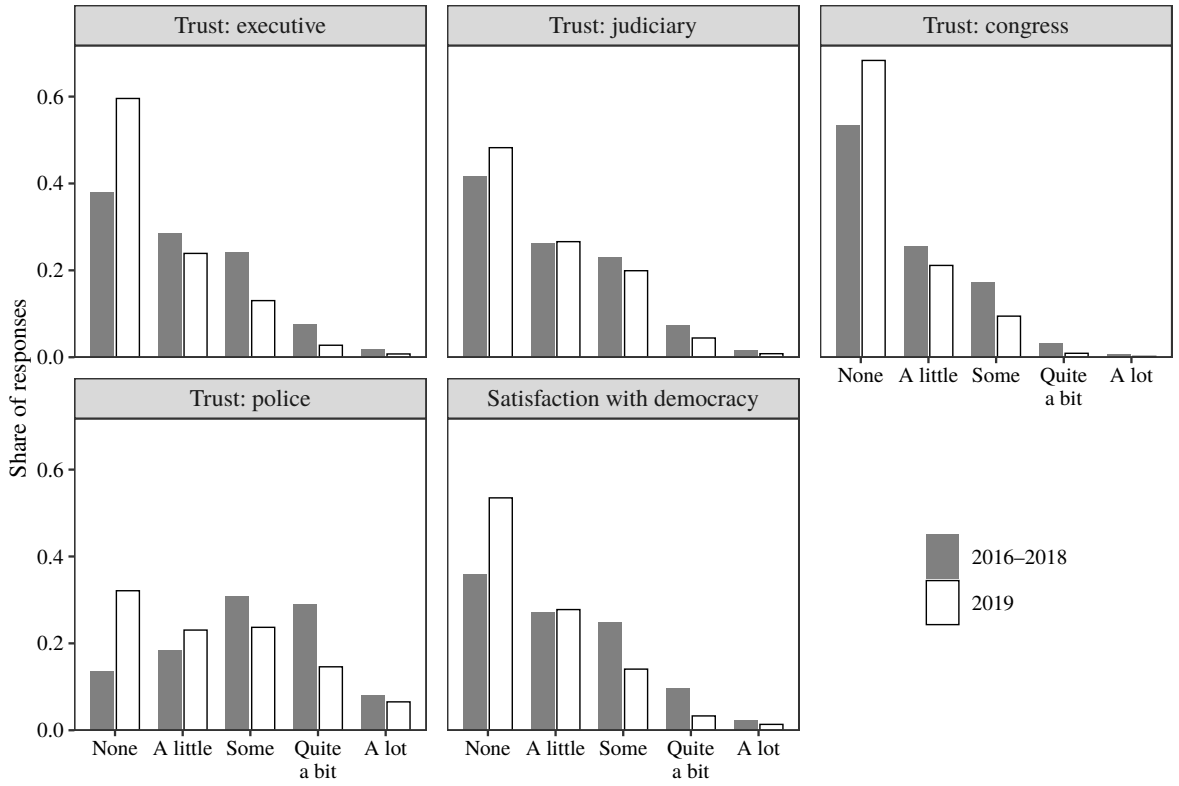

B.2 Measurement

B.2.1 Outcome coding: floor-share evidence

We code both substantive outcomes at the floor of their scales. For political trust, the outcome is the share of three institutions that a respondent rates *nada*, and for democracy, whether a respondent reports being *nada satisfecho* with it. Since a floor indicator is informative only if enough respondents choose the lowest category, we look at how often they do. In the full analytical panel, *nada* is the most common answer for each institution and for democracy, and police trust is the one exception, which is why we report it separately (Figure B3).

The three components of the low-trust share correlate 0.42 to 0.57 with one another (Spearman rank correlations, since every response is an ordered category). Hence, we combine them in one share.

FIGURE B3. Response distributions before and during 2019.

Note: Shares of nonmissing responses within each period: grey, 2016–2018 pooled; white, 2019. Full analytical panel.

B.2.2 Trust index, by component

We also fit the triple difference for each item separately, running the pre-trend protocol of Section B.3.3 on each item's own fit. All three components move with the composite on the floor share, so the composite does not rest on one institution (Table B4).

TABLE B4. Own-zone exposure effects on each trust-index item.

	Level			Low-share			
Item	Effect (SE)	*p*	Pre-trend *p*	Effect (SE)	*p*	Pre-trend *p*	Zones

Trust: executive	−0.060 (0.121)	0.620	0.721	−0.068 (0.089)	0.447	0.882	123 / 458
Trust: judiciary†	0.174 (0.142)	0.222	0.214	−0.166 (0.096)	0.083	0.714	123 / 459
Trust: congress	−0.089 (0.145)	0.539	0.650	−0.070 (0.093)	0.453	0.502	123 / 459
Panel C: Municipalities where protest surged: implied							
Trust: executive	−0.042 (0.065)	0.521	0.721	0.013 (0.033)	0.682	0.882	109 / 428
Trust: judiciary†	0.009 (0.059)	0.881	0.214	0.047 (0.036)	0.189	0.714	109 / 429
Trust: congress	−0.040 (0.056)	0.480	0.650	0.010 (0.035)	0.784	0.502	109 / 429

Note: Full-sample DDD, respondent and municipality-by-wave fixed effects; reference year 2018. †: the level fit adds baseline-outcome trends by the pre-trend protocol. Level: the 1–5 score. Low-share: indicator for *none*. Zone-clustered SEs in parentheses; *p* two-tailed. Panel C: Panel A plus Panel B, joint-covariance SE. Pre-trend *p*: joint test of the four 2016–2017 treatment and DDD terms, per item and metric. Zones: zones with an exposed respondent / the other zones in the same municipalities; Panel B counts both strata.

B.2.3 Police trust by wave

The main estimates table reports no police-trust effect distinguishable from zero at conventional levels in any of its three DDD components. Trust in the *Carabineros* decreased everywhere, almost equally in exposed and unexposed zones (Figure B4), and the municipality-by-wave fixed effects absorb exactly that kind of common movement.

FIGURE B4. Distribution of trust in police by wave and exposure.

Note: No-surge stratum. The five-point police-trust item is collapsed to three bands: none; a little or some; quite a lot. Bars sum to one within each wave and group.

B.3 Identification checks

B.3.1 Pretreatment balance

One concern with this design is that people in different census zones may report police violence at different rates, since the INDH registry records a violation only once it is reported. Note that the municipality-by-wave fixed effects absorb any such difference between municipalities, so it could matter only between zones of the same municipality. For this, we looked at variables in the survey that could predict reporting, and compared zones with and without cases within the same municipality. Exposed zones barely differ from their municipal neighbors on the measures closest to a propensity to report (Table B5). Their compositional differences, which account for the joint imbalance in the surge stratum, are fixed traits that the respondent fixed effect absorbs. Panel completion also differs by exposure, most clearly in the surge stratum (Table B6).

TABLE B5. Zone balance within municipalities, by protest stratum.

Measure	Treated	Untreated	Difference	SMD	*p*
Panel A: No protest surge ($S_c < 1$), census-zone measures (z-scores)					
Population density	−0.249	−0.436	0.329	0.49	0.006
Mean schooling	−0.008	−0.070	0.142	0.19	0.537
Unemployment rate	0.002	0.043	0.104	0.12	0.679

Panel H: Protest surge ($S_c \geq 1$), all measures					
Joint test, 15 measures					0.001

Note: Treated zones have an INDH-registered event by the wave-4 interview. Treated, Untreated: unweighted zone means in municipalities holding both kinds of zone (no protest surge: 8 of 18; protest surge: 45 of 72). Difference: treatment coefficient from a zone regression with municipality fixed effects. SMD: Difference over the pooled treated and untreated standard deviation. *p*: two-tailed, from 10,000 within-municipality reassignments of treatment; the joint test sums squared standardized differences.

TABLE B6. Panel completion by exposure and protest stratum.

	No protest surge ($S_c < 1$)		Protest surge ($S_c \geq 1$)	
Measure	Treated	Control	Treated	Control
Share observed all four waves	0.528	0.653	0.620	0.527
χ^2 p, equal four-wave completion	0.057		<0.001	
Mean waves observed	3.11	3.36	3.30	3.12
Respondents	72	412	374	2,360

Note: Treated: respondents in zones with an INDH-registered event by the wave-4 interview. Waves are counted over 2016–2019. χ^2 p: test of equal four-wave completion between treated and control respondents within the stratum, shown under Treated.

B.3.2 Identifying condition: relative pre-trends across protest strata

Olden and Møen (2022) show that the triple-difference design rests on one identifying condition: without treatment, the treated–control differential must evolve similarly across the $S_c \geq 1$ and $S_c < 1$ protest strata. That condition supports δ_{2019}, the DDD contrast, while interpreting β_{2019}, the $S_c < 1$ treatment DiD, on its own also requires ordinary parallel trends within that stratum. Tested in the same fits as the main estimates, the implication of each identifying condition holds for every outcome (Table B7), although with two pre-period waves these tests have little power against slow-moving violations.

TABLE B7. Pre-period tests of the triple-difference identifying condition.

Outcome	2016 (SE)	2017 (SE)	Joint F	p
Panel A: Relative pre-trend across protest strata: DDD interactions				
Political trust: low share	−0.045 (0.091)	−0.091 (0.084)	0.65	0.521
Satisfaction with democracy: not satisfied share	−0.096 (0.116)	−0.039 (0.099)	0.35	0.708
Police trust: level	−0.153 (0.302)	−0.315 (0.224)	1.17	0.311
Police trust: low share	0.051 (0.061)	0.050 (0.071)	0.40	0.672
Panel B: Pre-trend where protest did not surge: treatment interactions				
Political trust: low share	0.032 (0.084)	0.065 (0.076)	0.43	0.653
Satisfaction with democracy: not satisfied share	0.137 (0.108)	0.106 (0.088)	1.08	0.342
Police trust: level	0.192 (0.288)	0.296 (0.206)	1.16	0.313
Police trust: low share	−0.077 (0.052)	−0.054 (0.065)	1.10	0.333

Note: Panel A: DDD interactions for 2016 and 2017; Panel B: treatment interactions within municipalities with no protest surge. Zone-clustered SEs in parentheses. Joint F, p: the panel's 2016 and 2017 coefficients together, 2018 omitted, denominator degrees of freedom equal to clusters minus one. Specification, as the pre-trend protocol selects it: unadjusted DDD for every outcome.

B.3.3 Pre-trend protocol

While the main specification has respondent and municipality-by-wave fixed effects, it is possible that zones that would later be exposed were already trending apart before 2019. Hence, every Study 2 analysis follows the same pre-trend rule on its own fit. Where the joint test of a model's four placebo coefficients gives $p < .25$, we adjust it for differential trends using each

respondent's baseline value of the outcome and, if the test still gives $p < .25$, reweight its unexposed respondents. The four placebo coefficients are the 2016 and 2017 treatment terms and their surge interactions, or, in the vote split, their vote interactions. The baseline value y_{i0} is the respondent's latest observed value of the outcome from 2016 to 2018. Respondents with no value in those years receive the median of the observed values; no respondent is dropped. Since each step should bring the placebo coefficients closer to zero, we keep it only if it raises the joint p-value and shrinks the four coefficients. The weights, as even as possible, make each municipality's unexposed mass equal its exposed count and keep every 2016, 2017 and 2018 outcome gap between exposed and unexposed respondents within 0.07 pooled standard deviations in each protest stratum, and we winsorize them at their 99th percentile.

No outcome in the main estimates table triggers the rule, so the main table reports the unadjusted DDD for every outcome. With the baseline-outcome trends added anyway, every estimate keeps its sign and its 5 percent verdict (Table B8).

TABLE B8. Estimates with and without baseline-outcome trends.

	Baseline-outcome trends		Unadjusted DDD	
Outcome	Effect (SE)	*p*	Effect (SE)	*p*
Panel A: Municipalities where protest did not surge				
Political trust: low share	0.133 (0.063)	0.036	0.141 (0.068)	0.038
Satisfaction with democracy: not satisfied share	0.205 (0.063)	0.001	0.282 (0.087)	0.001
Police trust: level	−0.135 (0.166)	0.415	−0.093 (0.185)	0.615
Police trust: low share	0.058 (0.064)	0.369	0.031 (0.083)	0.711
Panel B: High-minus-low protest: DDD contrast				
Political trust: low share	−0.127 (0.067)	0.058	−0.120 (0.072)	0.098
Satisfaction with democracy: not satisfied share	−0.237 (0.070)	<0.001	−0.287 (0.094)	0.002
Police trust: level	0.274 (0.181)	0.130	0.219 (0.201)	0.276
Police trust: low share	−0.096 (0.070)	0.172	−0.069 (0.088)	0.433
Panel C: Municipalities where protest surged: implied				
Political trust: low share	0.005 (0.023)	0.812	0.021 (0.025)	0.382
Satisfaction with democracy: not satisfied share	−0.032 (0.031)	0.308	−0.004 (0.035)	0.902
Police trust: level	0.139 (0.072)	0.053	0.126 (0.078)	0.106
Police trust: low share	−0.038 (0.028)	0.169	−0.038 (0.028)	0.169

Note: Full-sample DDD, respondent and municipality-by-wave fixed effects, reference year 2018. Unadjusted DDD: the model without the baseline-outcome by wave terms; baseline-outcome trends: with them. Specification, as the pre-trend protocol selects it: unadjusted DDD for every outcome. Panel C: Panel A plus Panel B, SE from the joint covariance. Zone-clustered SEs in parentheses; *p* two-tailed.

B.4 Main estimates

B.4.1 Full regression

The full regression behind the main estimates table uses 89 of the 90 municipalities, because one municipality has a single respondent and all its municipality-by-wave cells are singletons

(Table B9). Its exposure-by-wave terms where protest did not surge are the coefficients plotted in the main text's event-study figure.

TABLE B9. Full-sample triple-difference model: full regression by outcome.

	Political trust: low share	Satisfaction with democracy: not satisfied share	Police trust: level	Police trust: low share
Panel A: Regression coefficients				
β_{2016} Exposed × 2016	0.032 (0.084)	0.137 (0.108)	0.192 (0.288)	−0.077 (0.052)
β_{2017} Exposed × 2017	0.065 (0.076)	0.106 (0.088)	0.296 (0.206)	−0.054 (0.065)
β_{2019} Exposed × 2019	0.141 (0.068)	0.282 (0.087)	−0.093 (0.185)	0.031 (0.083)
δ_{2016} Exposed × 2016 × surge	−0.045 (0.091)	−0.096 (0.116)	−0.153 (0.302)	0.051 (0.061)
δ_{2017} Exposed × 2017 × surge	−0.091 (0.084)	−0.039 (0.099)	−0.315 (0.224)	0.050 (0.071)
δ_{2019} Exposed × 2019 × surge	−0.120 (0.072)	−0.287 (0.094)	0.219 (0.201)	−0.069 (0.088)
Panel B: Implied effect where protest surged ($\beta + \delta$)				
Exposed × 2016	−0.012 (0.035)	0.040 (0.041)	0.038 (0.090)	−0.026 (0.032)
Exposed × 2017	−0.026 (0.036)	0.067 (0.045)	−0.019 (0.088)	−0.004 (0.028)
Exposed × 2019	0.021 (0.025)	−0.004 (0.035)	0.126 (0.078)	−0.038 (0.028)
2019 p, β_{2019}	0.038	0.001	0.615	0.711
2019 p, δ_{2019}	0.098	0.002	0.276	0.433
2019 p, $\beta_{2019} + \delta_{2019}$	0.382	0.902	0.106	0.169
Pre-trend p, β_τ	0.653	0.342	0.313	0.333
Pre-trend p, δ_τ	0.521	0.708	0.311	0.672
Pre-trend p, $\beta_\tau + \delta_\tau$	0.771	0.316	0.831	0.687
Respondent-waves	9,962	9,676	10,170	10,170
Respondents	3,169	3,114	3,212	3,212
Zones	748	747	749	749
Municipalities	89	89	89	89
Fixed effects	Yes	Yes	Yes	Yes

Note: One model per outcome. Specification, as the pre-trend protocol selects it: unadjusted DDD for every outcome. β_τ, δ_τ: the main text's estimating equation. Surge: $S_c \geq 1$. Panel B: $\beta_\tau + \delta_\tau$, with a delta-method SE. Pre-trend p: joint test of the 2016 and 2017 terms. Fixed effects: respondent and municipality-by-wave; reference year 2018. Zone-clustered SEs in parentheses; p two-tailed.

B.4.2 Common shift vs. local differential decomposition

Since every outcome moved in 2019, the local differential the design estimates is only part of each change. To compare the two parts, we split each outcome's 2018–2019 change where protest did not surge into a common shift and a local differential, which supports a size comparison, not a precise decomposition. For political trust and dissatisfaction, the local effect is about as large as the national 2019 shift (Table B10). For police trust most of the change is shared across zones, and a comparison of neighbors cannot attribute it to local exposure.

TABLE B10. Common and exposure-specific 2019 changes by outcome.

Outcome	Common shift	Local differential (SE)	p	Specification	Ratio
Political trust: low share	0.142	0.141 (0.068)	0.038	Unadjusted DDD	0.99
Satisfaction with democracy: not satisfied share	0.221	0.282 (0.087)	0.001	Unadjusted DDD	1.28
Police trust: low share	0.144	0.031 (0.083)	0.711	Unadjusted DDD	0.21
Police trust: level	−0.511	−0.093 (0.185)	0.615	Unadjusted DDD	0.18
Justified: police repress marches	−0.310	−0.055 (0.165)	0.738	Unadjusted DiD	0.18
Justified: police evict schools	−0.536	−0.111 (0.222)	0.617	Unadjusted DiD	0.21

Note: Municipalities with no protest surge. Common shift: raw 2018–2019 change in untreated zones. Local differential: the listed model's treatment × 2019 coefficient, zone-clustered SE in parentheses. Unadjusted DiD: estimated on the municipalities with no protest surge alone. Ratio: absolute local differential over absolute common shift.

B.5 Robustness

B.5.1 Alternative definitions of exposure

Additionally, we use three alternative definitions of exposure, since the estimated own-zone effect could depend on where the exposure boundary is drawn. They widen it to cases within 200, 250 and 300 m of the zone boundary, and each runs the pre-trend protocol of Section B.3.3 on its own fit (Figure B5 maps the exposed zones). At every buffer, both no-surge effects stay positive and both contrasts stay negative, all at the 5 percent level (Table B11).

TABLE B11. Triple-difference estimates under alternative exposure definitions.

Definition	Treated	Zones	$S_c < 1$ effect (SE)	p	DDD contrast (SE)	p	Pre-trend p
Panel A: Political trust: low share							
Own zone (main)	437	14 / 30	0.141 (0.068)	0.038	−0.120 (0.072)	0.098	0.849

Note: Full-sample DDD. Pre-trend protocol per row: †baseline-outcome trends; ‡balancing weights (pre-period gaps within 0.07 SD; at most 0.085 after winsorizing). No weights: the row above, unweighted. Treated: exposed respondents. Zone + *r* m: an event dated by the interview in the respondent's zone or within *r* m of its boundary. Zones: exposed / unexposed zones in no-surge municipalities that hold both. $S_c < 1$ effect: no-surge treatment DiD. Zone-clustered SEs. Pre-trend *p*: joint test of the 2016–2017 treatment and DDD terms.

FIGURE B5. Zones exposed within 200, 250 and 300 m of the zone boundary in the no-surge municipalities.

Note: 2017 INE urban census zones of the 10 no-surge municipalities that hold a zone exposed within 300 m. Shading: the smallest distance from the zone's boundary within which an INDH case dated by the interview lies; a zone is exposed if any of its core-panel respondents is. Heavy outline: exposed under the own-zone definition. Points: INDH case locations in any municipality. Each panel shows only the urban census zones around the municipality's sample zones, not its full territory; panels are not to a common scale. N: respondents of the core analysis panel in the municipality.

B.5.2 Alternative surge cuts

The no-surge stratum is defined by $S_c < 1$, and moving the cut to 1.3 and 1.5 adds two and five municipalities to that stratum. No municipality has an S_c between 0.94 and 1.25, so a cut at 1.1 or 1.2 would sort every municipality the same way as the main cut and repeat its estimates. The low-trust effect stays significant at 1.3 but not at 1.5, and the dissatisfaction effect stays positive at both cuts, at about half its size under the main cut, without reaching the 5 percent level (Table B12).

TABLE B12. Triple-difference estimates under alternative protest-surge cuts.

Outcome	$S_c < 1$ (main)	$S_c < 1.3$	$S_c < 1.5$
Panel A: Municipalities where protest did not surge: treatment DiD			
Political trust: low share	0.141*	0.141*	0.109†
Satisfaction with democracy: not satisfied share	0.282**	0.125	0.140
Police trust: level	−0.093	−0.205	−0.051
Police trust: low share	0.031	0.098	0.055
Zones	14 / 30	17 / 35	19 / 49
Panel B: High-minus-low protest: DDD contrast			
Political trust: low share	−0.120†	−0.124*	−0.089
Satisfaction with democracy: not satisfied share	−0.287**	−0.113	−0.134
Police trust: level	0.219	0.361†	0.182
Police trust: low share	−0.069	−0.152†	−0.103
Zones	123 / 458	123 / 458	123 / 458
Panel C: Municipalities where protest surged: implied treatment DiD			
Political trust: low share	0.021	0.017	0.020
Satisfaction with democracy: not satisfied share	−0.004	0.013	0.007
Police trust: level	0.126	0.156*	0.131†
Police trust: low share	−0.038	−0.054†	−0.048†
Zones	109 / 428	106 / 423	104 / 409

Note: No protest surge: S_c below the column's cut. Panel C: Panel A plus Panel B, with a delta-method SE. The pre-trend protocol runs on each cut's own fit and adds trends or weights to none. Significance marks use zone-clustered SEs. Pre-trend p: 0.15 to 0.89. Zones: zones with an exposed respondent / the other zones in the same municipalities (fewest across outcomes); Panel B counts both strata. $^{\dagger}p < 0.10$, $^{*}p < 0.05$, $^{**}p < 0.01$ (two-tailed).

B.5.3 Threshold cutpoint regressions

Panel A of the main estimates table estimates a no-surge effect on the mean of the 1–5 police-trust scale, which summarizes the distribution only if the scale steps are equal, and the instrument does not establish equal spacing between categories. We therefore refit the model with a binary indicator for a rating at or below each cutpoint, running the pre-trend protocol on each fit. The police null does not come from averaging an ordinal scale: at each of the four cutpoints the no-surge estimate is small and indistinguishable from zero (Table B13).

TABLE B13. 2019 police-trust effects at each threshold of the response scale.

Outcome	Share at or below	Effect (SE)	*p*	Pre-trend *p*	Obs.
Rating ≤ 1 (none)	0.176	0.031 (0.083)	0.711	0.566	10,170
Rating ≤ 2 (a little)	0.363	0.093 (0.104)	0.374	0.289	10,170
Rating ≤ 3 (some)	0.647	−0.005 (0.091)	0.957	0.923	10,170
Rating ≤ 4 (quite a bit)	0.907	−0.026 (0.028)	0.351	0.332	10,170

Note: Effect in municipalities with no protest surge, from the full-sample DDD. The pre-trend protocol, run per threshold, adds nothing. Outcome: indicator for a police-trust rating at or below the threshold (1 = none, 5 = a lot). Share at or below: share of no-surge observations. Respondent and municipality-by-wave fixed effects; reference year 2018; zone-clustered SEs in parentheses. Pre-trend *p*: joint test of the four 2016 and 2017 treatment and DDD terms. Obs.: respondent-waves.

B.6 Power and inference

B.6.1 Statistical power and minimum detectable effects

All three reported components come from the same full-sample fit, but the no-surge DiD and the DDD contrast rest on the 14 treated zones in municipalities without a protest surge, while the implied surge effect rests on 109. The usual $2.8 \times \text{SE}$ rule for a minimum detectable effect assumes a normal sampling distribution for the cluster-robust t statistic, so we check that assumption by simulation, permuting treatment across zones within each municipality and injecting a known effect into treated 2019 observations, either where protest did not surge or where it surged.

The cluster-robust t test over-rejects for all three components, so the conventional p-values are optimistic (Table B14). Although the political-trust effect is statistically significant, it falls below its detection threshold, as does its contrast, while the dissatisfaction effect and its contrast exceed theirs. In municipalities that surged, the estimates are near zero even though the design detects smaller effects there than where protest did not surge, so we read the DDD contrast as attenuation rather than noise. For police trust on the five-point scale, no injected effect on the simulated grid reaches 80 percent power where protest did not surge, so its null leaves the size of the effect open.

TABLE B14. Simulated false-positive rates and minimum detectable effects.

Outcome	False positives	MDE	Rule of thumb	Estimate
Panel A: Treatment DiD, no protest surge				
Political trust: low share	0.099	0.18	0.19	0.141
Satisfaction with democracy: not satisfied share	0.069	0.26	0.24	0.282
Police trust: level	0.075	–	0.52	−0.093
Police trust: low share	0.085	0.21	0.23	0.031
Panel B: High-minus-low DDD contrast				
Political trust: low share	0.093	0.20	0.20	−0.120
Satisfaction with democracy: not satisfied share	0.069	0.28	0.26	−0.287
Police trust: level	0.069	–	0.56	0.219
Police trust: low share	0.080	0.23	0.25	−0.069
Panel C: Implied DiD, protest surge				
Political trust: low share	0.064	0.07	0.07	0.021
Satisfaction with democracy: not satisfied share	0.066	0.10	0.10	−0.004
Police trust: level	0.075	0.21	0.22	0.126
Police trust: low share	0.071	0.08	0.08	−0.038

Note: 2,000 within-municipality zone permutations per point; each replication runs the pre-trend protocol on its own draw. False positives: rejection rate at 5% with no injected effect. MDE (minimum detectable effect): smallest injected effect rejected in 80% of replications (–: not reached on the grid, which ends at 0.40). Rule of thumb: 2.8 × SE. Estimate: the coefficient reported in the main estimates table.

B.6.2 Inference with few treated zones

While the main table uses cluster-robust standard errors, it is possible that with only 14 exposed zones in no-surge municipalities its t-tests reject a true null too often (MacKinnon and Webb 2020). Hence, following MacKinnon, Nielsen, and Webb (2023), we add jackknife standard errors, a wild cluster bootstrap, and two randomization tests that rerun the full model and the pre-trend protocol on each reassignment. Both dissatisfaction estimates clear 5 percent under every method, the low-trust no-surge effect only under the coefficient-based randomization test, and the low-trust contrast under none (Table B15). Dropping one zone at a time shows that no single zone drives the no-surge estimates.

TABLE B15. Inference with few treated zones.

		p-values				
	Estimate	Conventional	Jackknife	Wild bootstrap	RI-t	RI-β
Panel A: Political trust: low share						
DiD, no protest surge	0.141	0.038	0.162	0.093	0.084	0.041
High minus low	−0.120	0.098	0.253	0.162	0.157	0.107
Protest surge, implied	0.021	0.382	0.441	0.413	0.417	0.375
Panel B: Satisfaction with democracy: not satisfied share						
DiD, no protest surge	0.282	0.001	0.012	0.012	0.006	0.003
High minus low	−0.287	0.002	0.016	0.014	0.009	0.005
Protest surge, implied	−0.004	0.902	0.915	0.908	0.905	0.900
Panel C: Police trust: level						
DiD, no protest surge	−0.093	0.615	0.678	0.638	0.637	0.628
High minus low	0.219	0.276	0.365	0.313	0.306	0.284
Protest surge, implied	0.126	0.106	0.157	0.123	0.125	0.096
Panel D: Police trust: low share						
DiD, no protest surge	0.031	0.711	0.775	0.751	0.736	0.692
High minus low	−0.069	0.433	0.542	0.491	0.475	0.403
Protest surge, implied	−0.038	0.169	0.234	0.183	0.207	0.193

Note: Two-tailed *p*-values on Table 1's fits (unadjusted DDD); each RI draw reruns the pre-trend protocol. Conventional: zone-clustered (CV_1) t-test. Jackknife: CV_3 standard errors with $t(G-1)$. Wild bootstrap: restricted wild cluster bootstrap, 9,999 Rademacher draws. RI-t, RI-β: randomization inference on the t-statistic and the coefficient, 9,999 within-municipality zone reassignments. Protest surge, implied: the DiD with no protest surge plus high minus low. G = 747–749 zones; 14 exposed zones in municipalities with no protest surge and 109 in those with one.

B.7 Heterogeneity

B.7.1 2017 presidential vote

We compare the 2019 treatment effect by first-round vote in the November 2017 presidential election, right-wing Sebastián Piñera against another candidate, among respondents with a recorded first-round vote (ELSOC has no item for the December runoff), each model running the pre-trend protocol of Section B.3.3 on its own fit. Only the police-trust difference reaches conventional significance, with a negative effect among respondents who voted for another candidate and a positive one among Piñera voters (Table B16).

TABLE B16. Effect by 2017 vote, Piñera versus other candidates: full regression.

	Political trust: low share	Satisfaction with democracy: not satisfied share	Police trust: level	Police trust: low share
Panel A: Exposure × wave, other candidates				
Exposed × 2016	0.039 (0.073)	0.212 (0.190)	0.039 (0.298)	0.036 (0.079)
Exposed × 2017	−0.091 (0.131)	0.109 (0.127)	0.166 (0.232)	−0.098 (0.108)
Exposed × 2019	0.278 (0.088)	0.321 (0.125)	−0.536 (0.297)	0.168 (0.140)
Panel B: Piñera vote × wave				
Piñera × 2016	0.063 (0.061)	0.108 (0.090)	0.168 (0.167)	−0.039 (0.048)
Piñera × 2017	0.044 (0.065)	0.183 (0.072)	−0.094 (0.162)	0.059 (0.059)
Piñera × 2019	0.027 (0.047)	0.052 (0.076)	0.219 (0.163)	−0.027 (0.052)
Panel C: Exposure × Piñera vote × wave				
Exposed × Piñera × 2016	0.010 (0.142)	−0.094 (0.294)	−0.167 (0.571)	−0.241 (0.159)
Exposed × Piñera × 2017	0.205 (0.177)	0.092 (0.251)	0.706 (0.395)	−0.204 (0.118)
Exposed × Piñera × 2019	−0.261 (0.196)	−0.368 (0.226)	0.930 (0.443)	−0.249 (0.157)
Panel D: Implied 2019 effect among Piñera voters				
Exposed × 2019	0.017 (0.157)	−0.048 (0.235)	0.394 (0.343)	−0.081 (0.147)
Panel E: Baseline outcome × wave				
Baseline outcome × 2016			−0.683 (0.087)	
Baseline outcome × 2017			−0.539 (0.064)	
Baseline outcome × 2019			−0.531 (0.071)	
2019 difference (Panel C), *p*	0.186	0.106	0.038	0.117
Pre-trend *p*, other candidates	0.641	0.479	0.774	0.427
Pre-trend *p*, difference	0.491	0.751	0.204	0.195
Respondent-waves	978	949	987	987
Respondents, Piñera / other	142 / 145	136 / 143	143 / 144	143 / 144
Zones	91	92	92	92
Baseline-outcome trends	No	No	Yes	No
Balancing weights	No	No	No	No
Fixed effects	Yes	Yes	Yes	Yes

Note: Municipalities with no protest surge; respondents with a recorded 2017 first-round vote. One pooled model per outcome. Other candidates: any candidate other than Piñera. Panel D: the 2019 terms of Panels A and C summed, with a delta-method SE. Pre-trend *p*: joint test of the 2016 and 2017 terms of Panel A (other candidates) or Panel C (difference). Panel E: baseline-outcome trends, where kept. Fixed effects: respondent and municipality-by-wave; reference year 2018. Zone-clustered SEs in parentheses; *p* two-tailed.

B.8 Comparison with Ang and Tebes (2024)

Ang and Tebes (2024) is the closest published design. It estimates the civic response to police killings in California by comparing Census blocks where a killing occurred with other blocks in the same block group. Like theirs, our treatment is hyperlocal, our comparison set is a neighborhood, and our model includes neighborhood-by-period fixed effects. This study matches their event study, joint pre-period test and treated-control comparison, clusters at the zone, where treatment is assigned, and also reports the empirical test size and minimum detectable effect that they do not (Table B17).

TABLE B17. Design and diagnostic standards against Ang and Tebes (2024).

Item	Ang and Tebes	This study	Status
Panel A: Design			
Comparison set	Blocks within block group	Zones within municipality	matched
Treatment timing	First killing between elections	Own-zone INDH event by interview	matched
Identifying units	285 treated blocks; 68,326 total	123 treated zones; 747 to 749 total, by outcome	differs (scale)
Panel B: Inference			
Cluster level	Block group	Census zone	differs (unit)
Panel C: Assumptions			
Event study	Leads and lags; 95% intervals	2016, 2017, and 2019 interactions	matched
Joint pre-trend test	Reported	Four-restriction Wald test per outcome	matched
Treated vs control balance	Demographics and prior outcomes	Covariates, baselines, changes, completion	matched
Panel D: Robustness			
Placebo treatment	Post-window treated blocks	Not implemented	not implemented
Proximity check	Effects by distance bin to 2 miles	Zone plus 200, 250 and 300 m	differs (redefinition, not bins)
Alternative specifications	Control and sample variants	Protest-surge cuts, imputed outcomes	matched
Selective migration	Transfer and residence checks	Movers dropped; completion differs by exposure	differs

Continued on next page.

Table B17 continued.

Item	Ang and Tebes	This study	Status
Panel E: Extensions			
Heterogeneity	Race, age, party, location	Ideology and 2017 vote	differs (moderators)
Mechanism	Victim status, referenda, media	Trust subitems	differs (measurement)
Panel F: Calibration			
Size and detectable effect	Not reported	Permutation size and simulated MDE	beyond

Note: Status: matched; differs, with the aspect in parentheses where one applies; beyond: reported here but not in the benchmark; not implemented: in the benchmark but not here.

C Study 3

C.1 Design, measurement, and sample

Studies 1 and 2 estimate the effect of exposure to police violence within single countries. Study 3 combines two cross-sectional analyses over the same fifteen countries. The 2023 analysis estimates how political trust and trust in police are associated with satisfaction with democracy in Latinobarómetro and LAPOP. The 2008 analysis estimates how respondents' reports of police abuse are associated with political trust, trust in police, and satisfaction with democracy.

We estimate a survey-weighted linear multilevel regression for each outcome. Each country receives its own intercept and its own slopes on the focal predictors; the controls enter with one slope shared across countries. We standardize outcomes and multi-item indices within each dataset. Tables C1, C2 and C3 report the constructs, the estimation samples and those samples by country.

TABLE C1. Measurement of constructs by dataset.

Construct	LAPOP 2008	LAPOP 2023	Latinobarómetro 2023
Satisfaction with democracy	pn4; 4 points	pn4; 4 points	P11STGBS.A; 4 points
Trust in police	b18; 7 points	b18; 7 points	P13STGBS.B; 4 points
Political trust	Congress, president, justice system	Congress, president, courts (fair trial)	Congress, president, judiciary
Economic perceptions	Four-item index	Two-item index	Four-item index
Interpersonal trust	it1a and it1b; index	it1; 4 points	P9STGBS; binary
Police abuse	vic27; any mistreatment in prior year	Not asked	Not asked

Note: Higher values indicate more satisfaction or trust.

TABLE C2. Datasets and estimation samples.

Dataset	Fielded	Analytic N	Countries	Multilevel specification
LAPOP 2008	23,894	15,555–15,895	15	Random slope on police abuse
LAPOP 2023	23,455	18,026	15	Random slopes on both trust measures
Latinobarómetro 2023	16,804	12,425	15	Random slopes on both trust measures

Note: Fielded: respondents interviewed in the fifteen countries. Analytic N: complete cases in the estimated model; the LAPOP 2008 range spans its outcome-specific samples.

Every outcome equation and mediation regression uses the same controls within a dataset, and only the substantive-comparison models add the rival explanations (Table C4).

TABLE C3. Estimation samples by country.

Country	LAPOP 2008		LAPOP 2023	Latinobarómetro 2023
	Trust outcomes	Satisfaction		
Argentina	900	864	1,154	818
Bolivia	1,485	1,455	1,295	850
Brazil	994	969	1,196	894
Chile	1,053	1,034	757	747
Colombia	1,018	989	1,123	988
Costa Rica	966	955	1,257	807
Dominican Republic	971	953	1,266	848
El Salvador	1,345	1,329	1,365	680
Guatemala	879	847	1,210	767
Honduras	1,003	962	1,124	679
Mexico	1,111	1,088	1,324	810
Panama	1,185	1,168	1,252	781
Paraguay	780	777	1,097	826
Peru	1,014	984	1,347	977
Uruguay	1,191	1,181	1,259	953
Total	15,895	15,555	18,026	12,425

Note: Respondents in each model's estimation sample. LAPOP 2008: the political trust and trust in police models share one sample, and the two satisfaction models another. LAPOP 2023 and Latinobarómetro 2023: the satisfaction model.

TABLE C4. Control variables by dataset and equation.

Element	Variables, source items and coding
Panel A: LAPOP 2008	
Equations	Political trust, trust in police, and satisfaction with democracy on police abuse; satisfaction with democracy on both trust measures; both serial-mediation systems.
Baseline controls	Age (q2; 18–23, 24–29, 30–44, 45–59, 60+); female indicator (q1); education (ed; five levels); income (q10; five fixed bracket groups); household type (q11, q12, q12a; five sizes); ethnicity (etid; six groups); religion (q3; five groups); ideology (l1; 1–10); crime victimization (vic1; prior 12 months); occupation (ocup4a, ocup1a; five groups); urban residence (ur = 1); national capital (tamano = 1); large city (tamano = 2); police bribe solicitation (exc2 = 1).
Augmented models add	Economic perceptions (soct1, soct2, idio1, idio2; reversed, 0–1 item scales summed, z-scored); political interest (pol1, pol2; reversed, summed, z-scored); interpersonal trust (it1a, it1b; reversed, summed, z-scored).
Panel B: LAPOP 2023	
Equations	Satisfaction with democracy on both trust measures; political trust on trust in police; trust in police on political trust.
Baseline controls	Economic perceptions (soct2, idio2; reversed, 0–1 item scales summed, z-scored); political interest (pol1; reversed, z-scored); interpersonal trust (it1; reversed, z-scored); age (q2; years); female indicator (q1tc_r); education (edre; levels 0–6); household income (q10inc; five brackets); assets (r3, r6, r7, r12, r15, r16, r18; count, at least 5 answered, z-scored); urban residence (ur = 1); crime victimization (vic1ext; prior 12 months); ideology (l1n; 1–10).
Augmented models add	Corruption perceptions (exc7new; z-scored).

Continued on next page.

Table C4 continued.

Element	Variables, source items and coding
Panel C: Latinobarómetro 2023	
Equations	Satisfaction with democracy on both trust measures; political trust on trust in police; trust in police on political trust.
Baseline controls	Economic perceptions (P5, P6, P7, P8; reversed, 0–1 item scales summed, z-scored); political interest (P40, P44; reversed, 0–1 item scales summed, z-scored); interpersonal trust (P9; reversed binary, z-scored); age (EDAD; years); female indicator (SEXO); education (S11; attainment code); interviewer-rated status (S24; reversed); assets (S20.A–K; count of 11, at least 8 answered, z-scored); ideology (P16; 0–10); crime victimization (P58; respondent or relative); national capital (TAMCIUD = 8) and large city (TAMCIUD = 6–8).
Augmented models add	Corruption perceptions (P60; reversed, z-scored); vote status (P43; government, opposition, neither).

Note: Every equation listed includes the full baseline roster. LAPOP 2008 enters its categorical controls as indicator blocks, with the modal category as reference. The two 2023 surveys enter their baseline controls as single terms, education and income included; vote status (Latinobarómetro 2023) enters as indicators against government voters. z-scored: standardized within dataset.

C.2 Focal estimates and substantive comparisons

TABLE C5. Focal coefficients by dataset.

Predictor	Outcome	Estimate (SE)	95% CI	N	Countries
Panel A: LAPOP 2008					
Police abuse	Political trust	−0.204 (0.033)	[−0.269, −0.139]	15,895	15
Police abuse	Trust in police	−0.402 (0.045)	[−0.490, −0.315]	15,895	15
Panel B: LAPOP 2023					
Political trust	Satisfaction with democracy	0.335 (0.012)	[0.312, 0.358]	18,026	15
Trust in police	Satisfaction with democracy	0.046 (0.013)	[0.021, 0.072]	18,026	15
Panel C: Latinobarómetro 2023					
Political trust	Satisfaction with democracy	0.268 (0.018)	[0.233, 0.302]	12,425	15
Trust in police	Satisfaction with democracy	0.041 (0.009)	[0.023, 0.059]	12,425	15

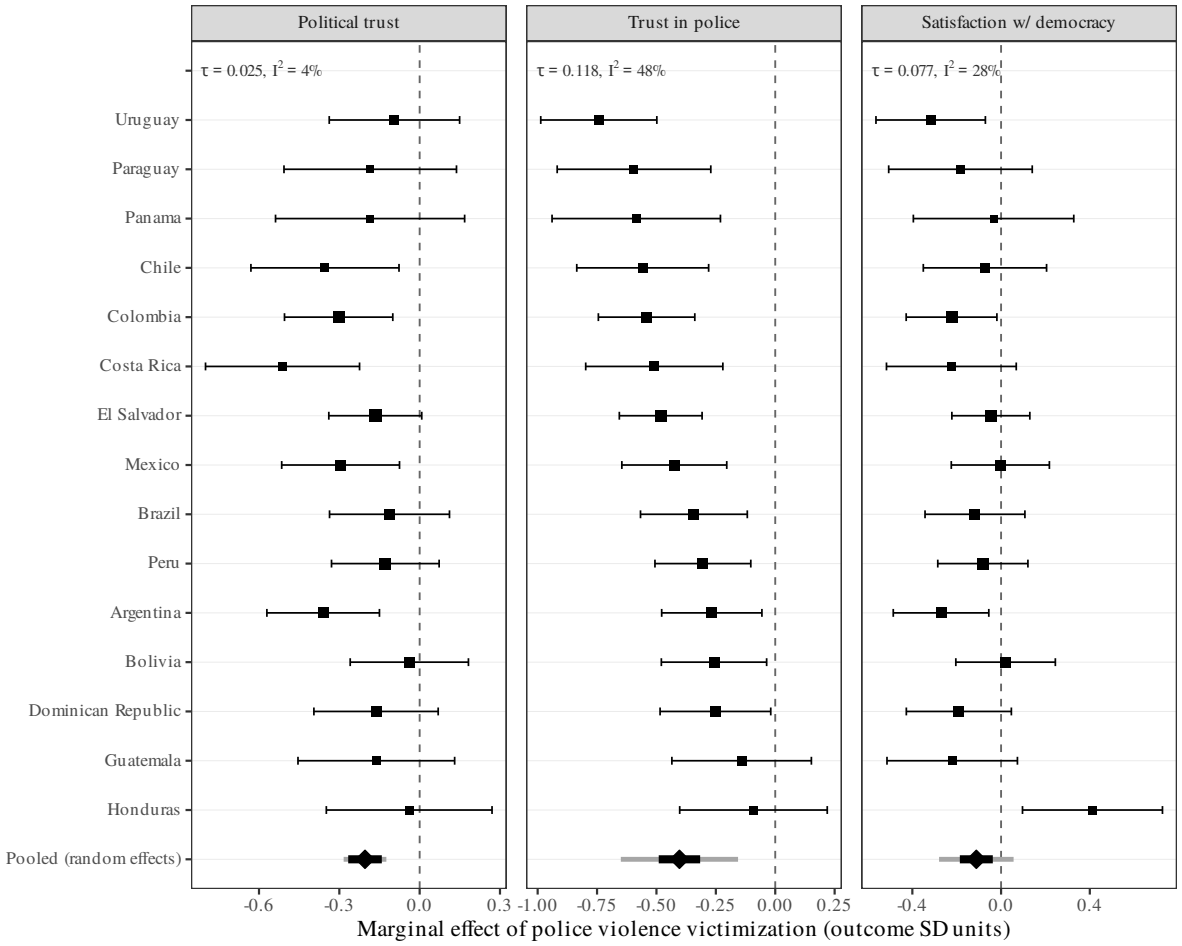

Note: Survey-weighted multilevel models with country random intercepts and random slopes on the focal predictors. Outcomes and trust predictors are standardized within dataset; police abuse is coded 1 if reported. 95% CIs use Satterthwaite degrees of freedom.

Respondents who report police abuse show lower trust in police and lower political trust, and in both 2023 surveys political trust is the far stronger predictor of satisfaction with democracy (Table C5). Both patterns hold with the rival predictors in the models (Table C7). The two

trust measures are recorded at the same moment, so rather than assume a mediation order, we fit either ordering and present the results in Table C6. In descriptive decompositions, political trust accounts for more of the abuse-satisfaction association than police trust alone.

Figure C1 estimates the 2008 associations country by country, without pooling the country slopes toward a common mean. Estimated country by country, both trust associations are negative in all fifteen countries. A random-effects model then combines the fifteen country estimates, and for both trust outcomes the prediction interval for a further country lies below zero.

FIGURE C1. Police abuse and the three outcomes, country by country, LAPOP 2008.

Note: LAPOP 2008, fifteen countries. Squares: each country's police-abuse coefficient from a first-stage weighted linear model with country-specific intercepts and abuse slopes and shared control coefficients, sized by the country's weight in the second stage; thin bars: 95% confidence intervals. Diamond: random-effects pooled mean (restricted maximum likelihood), with its 95% confidence interval (thick bar) and 95% prediction interval (light grey bar). τ: between-country standard deviation of the coefficient; I^2: share of the variation across countries due to heterogeneity rather than sampling error. Countries ordered by their trust-in-police coefficient in all three panels. The two trust outcomes share one sample; satisfaction with democracy has its own. Outcomes in standard deviations.

TABLE C6. Mediation decomposition by ordering and dataset.

Ordering	Direct	Indirect	Total	% mediated	E-value	Benchmark RR
Panel A: LAPOP 2008						
A: police abuse → trust in police → political trust → satisfaction	−0.034	−0.078**	−0.112**		1.28	1.08
via trust in police alone		−0.018**		16.1%		
via both in series		−0.060**		53.7%		
via political trust alone	0.002			−1.7%		
direct, net of both	−0.036			32.0%		
B: police abuse → political trust → trust in police → satisfaction	−0.049	−0.063**	−0.112**		1.28	1.08
via political trust alone		−0.058**		51.6%		
via both in series		−0.005**		4.5%		
via trust in police alone	−0.013**			11.7%		
direct, net of both	−0.036			32.2%		
Panel B: LAPOP 2023						
A: trust in police → political trust → satisfaction	0.046**	0.146**	0.193**	75.9%	2.22	1.14
B: political trust → trust in police → satisfaction	0.335**	0.024**	0.359**	6.6%	1.28	1.14
Panel C: Latinobarómetro 2023						
A: trust in police → political trust → satisfaction	0.041**	0.084**	0.124**	67.2%	2.03	1.34
B: political trust → trust in police → satisfaction	0.268**	0.017**	0.284**	5.8%	1.27	1.34

Note: Police abuse is coded 1 if reported. % mediated (2023 rows): indirect share of the total. LAPOP 2008 indented rows split the direct and indirect effects by channel; their four shares sum to 100%. E-value: the smaller of the two path-specific values. Benchmark RR: max(RR, 1/RR) of the strongest measured covariate in 2023 and, in 2008, of the larger of the two measured victimization covariates (police bribe solicitation and crime victimization). $^{**}p < 0.01$ (two-tailed; bootstrap over 1,000 country resamples).

TABLE C7. Focal and rival-predictor coefficients, augmented models.

Panel A: Police abuse and rival predictors, LAPOP 2008

Predictor	Political trust	Trust in police	Satisfaction with democracy
Police abuse	−0.177*** (0.031)	−0.387*** (0.044)	−0.086* (0.038)
Crime victimization	−0.108*** (0.019)	−0.107*** (0.019)	−0.068*** (0.019)
Police bribe solicitation	−0.140*** (0.025)	−0.211*** (0.025)	−0.114*** (0.025)
Economic perceptions	0.276*** (0.008)	0.158*** (0.008)	0.243*** (0.008)
Interpersonal trust	0.087*** (0.008)	0.080*** (0.008)	0.044*** (0.008)
Political interest	0.078*** (0.008)	0.021** (0.008)	0.023** (0.008)

Panel B: Satisfaction with democracy, 2023

Predictor	LAPOP 2023	Latinobarómetro 2023
Political trust	0.318*** (0.012)	0.241*** (0.018)
Trust in police	0.042** (0.013)	0.042*** (0.009)
Economic perceptions	0.114*** (0.007)	0.247*** (0.009)
Interpersonal trust	0.023*** (0.007)	0.060*** (0.007)
Political interest	0.030*** (0.007)	0.028*** (0.008)
Crime victimization	−0.077*** (0.016)	−0.051** (0.017)
Corruption perceptions	−0.075*** (0.007)	0.054*** (0.008)
Opposition voter (vs. government)	–	−0.159*** (0.025)

Note: Augmented models: the baseline controls plus the rival predictors. Coefficients with standard errors in parentheses. Outcomes and continuous predictors are standardized within dataset. Corruption perceptions: higher values mean more perceived corruption in LAPOP 2023 and more perceived progress against corruption in Latinobarómetro 2023. –: not measured in that survey. $^{*}p < 0.05$, $^{**}p < 0.01$, $^{***}p < 0.001$ (two-tailed; Satterthwaite df).

C.3 Sensitivity and weighting

We report two sensitivity analyses. The E-values in Table C8 (VanderWeele and Ding 2017) show how strong an unmeasured confounder would need to be, relative to the strongest measured covariate in 2023 and, in 2008, the larger of the two measured victimization covariates, police bribe solicitation and crime victimization. Political trust and the 2008 police-abuse associations clear these benchmarks, while the smaller police-trust association falls below its benchmark in Latinobarómetro. The entropy-balanced 2008 estimates in Table C9 (Hainmueller 2012) retain the sign and approximate magnitude of all three reported police-abuse associations after balancing the observed covariates.

TABLE C8. E-values for the focal associations.

Predictor	Outcome	β	E-value (point)	E-value (CI limit)	Benchmark RR
Panel A: LAPOP 2008					
Police abuse	Political trust	−0.204	1.76	1.57	1.18
Police abuse	Trust in police	−0.397	2.35	2.08	1.24
Panel B: LAPOP 2023					
Political trust	Satisfaction with democracy	0.335	2.22	2.14	1.14
Trust in police	Satisfaction with democracy	0.046	1.28	1.18	1.14
Panel C: Latinobarómetro 2023					
Political trust	Satisfaction with democracy	0.268	2.03	1.91	1.34
Trust in police	Satisfaction with democracy	0.041	1.27	1.19	1.34

Note: β: focal coefficient, with the outcome and trust predictors in standard deviations and police abuse coded 0/1. E-value: the minimum risk ratio an unmeasured confounder would need with both predictor and outcome to explain away the estimate; CI limit: the same for the confidence limit nearer the null. Risk ratios are approximated as $\exp(0.91\,\beta/\sigma)$, with σ the residual standard deviation. Benchmark RR: max(RR, 1/RR) of the strongest measured covariate in 2023 (economic perceptions) and, in 2008, of the larger of the two measured victimization covariates (police bribe solicitation and crime victimization). LAPOP 2008 rows use each outcome's complete cases (N = 15,938 for political trust, 16,600 for trust in police).

TABLE C9. Entropy-balanced differences by police abuse, LAPOP 2008.

Outcome	Difference (SE)	95% CI	Max |SMD|	Effective N treated / control	Gate
Political trust	−0.205 (0.037)	[−0.287, −0.124]	0.00	910 / 3,852	Pass
Trust in police	−0.389 (0.044)	[−0.485, −0.293]	0.00	927 / 3,996	Pass
Satisfaction with democracy	−0.115 (0.042)	[−0.207, −0.023]	0.00	915 / 3,995	Pass

Note: Difference: entropy-balanced difference for respondents who report police abuse (ATT), with CR2 standard errors clustered by country; 95% CI from t with Satterthwaite df. Max |SMD|: largest absolute standardized mean difference across main-effect covariates after weighting. Effective N: Kish effective sample size. Gate: passes when overlap, positivity, covariate balance, effective sample size and weight concentration all meet their thresholds.

C.4 Moderation, measurement, and missing data

Ideology differentiates the 2008 political-trust and democratic-satisfaction associations (Table C10). The associations are similar for white and non-white respondents: none of the seven race differences is distinguishable from zero (Table C10 and Figure C2).

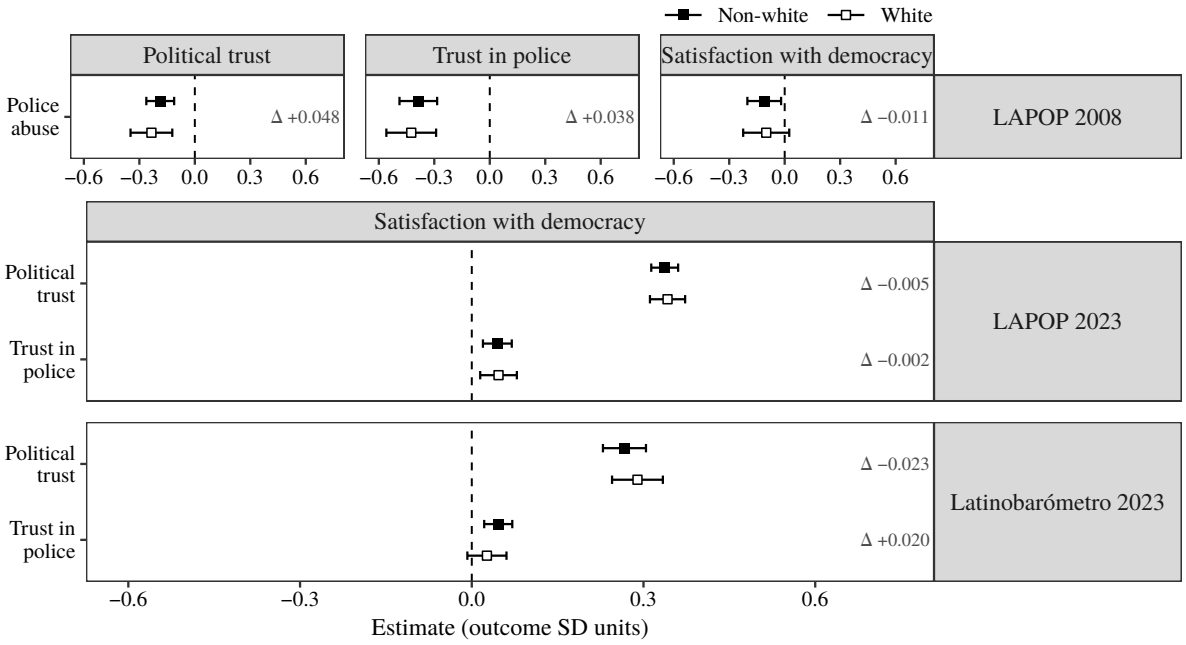

The three-item political-trust measure agrees closely with LAPOP's published scales in the fifteen matched countries of both 2023 surveys, and complete-case, response-reweighted and imputed estimates retain their sign and similar magnitude (Table C11).

TABLE C10. Ideology and race contrasts in the focal associations.

	Right − left		Non-white − white	
Association	Difference (SE)	*p*	Difference (SE)	*p*
Panel A: LAPOP 2008				
Police abuse → political trust	0.172 (0.073)	0.018	0.048 (0.068)	0.484
Police abuse → trust in police	0.069 (0.072)	0.339	0.038 (0.072)	0.597
Police abuse → satisfaction	0.192 (0.072)	0.007	−0.011 (0.069)	0.877
Panel B: LAPOP 2023				
Political trust → satisfaction	0.019 (0.016)	0.214	−0.005 (0.015)	0.748
Trust in police → satisfaction	0.031 (0.016)	0.048	−0.002 (0.016)	0.896
Panel C: Latinobarómetro 2023				
Political trust → satisfaction	−0.001 (0.019)	0.963	−0.023 (0.018)	0.218
Trust in police → satisfaction	0.034 (0.019)	0.066	0.020 (0.018)	0.277

Note: Each contrast is the interaction of the focal predictor with the moderator in one model. Right − left: right (6–10) minus left (0–4 in Latinobarómetro, 1–4 in LAPOP); the midpoint and non-placement are excluded. Non-white − white: all recorded non-white categories pooled. *p*: two-tailed; Satterthwaite df.

FIGURE C2. Associations by race: white and non-white respondents.

Note: Upper block: LAPOP 2008 police-abuse associations; lower block: 2023 trust-to-satisfaction associations. Predictors run down the left, outcomes across the top, and the dataset is given at the right. Non-white: all recorded non-white categories pooled. Bars are 95% confidence intervals. Δ: the difference between the two groups, non-white minus white. Both blocks span the same horizontal range.

TABLE C11. Scale reliability and missing-data sensitivity.

Panel A: Reliability of the three-item scale and LAPOP's published scales

Source	Scale	Items	Std. α	N
Study 1 · Brazil experiment	Three-item scale	3	0.81	1,248
Study 2 · ELSOC Chile	Three-item scale	3	0.72	6,270
LAPOP 2008	Three-item scale	3	0.74	22,010
	LAPOP published (4 items)	4	0.79	21,705
	LAPOP published (5 items)	5	0.85	21,612
LAPOP 2023	Three-item scale	3	0.71	22,446
	LAPOP published (4 items)	4	0.83	22,382
	LAPOP published (5 items)	5	0.84	22,290
Latinobarómetro 2023	Three-item scale	3	0.76	15,984
	LAPOP published (4 items)	4	0.79	15,693
	LAPOP published (5 items)	5	0.85	15,661

Panel B: LAPOP 2008

Association	Std. α	ω	Complete cases β	Reweighted β	Imputed β
Police abuse → political trust	0.74	0.75	−0.205	−0.206	−0.179
Police abuse → trust in police	–	–	−0.393	−0.396	−0.367
Panel C: LAPOP 2023					
Political trust → satisfaction	0.71	0.73	0.336	0.334	0.336
Trust in police → satisfaction	–	–	0.046	0.043	0.038
Panel D: Latinobarómetro 2023					
Political trust → satisfaction	0.76	0.76	0.263	0.270	0.263
Trust in police → satisfaction	–	–	0.048	0.042	0.040

Note: Std. α: standardized Cronbach's α. ω: McDonald's omega total. In Panels B–D both refer to the three-item political-trust index (–: single-item measure). Panels B–D: coefficients from country fixed-effects OLS. Complete cases and Imputed are unweighted; Imputed pools five predictive-mean-matching imputations. Reweighted weights complete cases by the design weight divided by the predicted response probability.

C.5 Full regression tables

TABLE C12. Full regression, LAPOP 2008: police abuse, base controls.

	Political trust	Trust in police	Satisfaction with democracy
Panel A: Predictors

Countries	15	15	15	15
Intercept SD	0.148	0.148	0.206	0.206
Slope SD, trust in police	0.033	0.033	0.026	0.025
Slope SD, political trust	0.025	0.025	0.056	0.058
Residual SD	0.848	0.848	0.818	0.818
Country share of variance	0.029	0.029	0.059	0.060
Slope correlations	Estimated	Estimated	Estimated	Estimated

Note: Survey-weighted multilevel models fitted by REML, with country random intercepts and random slopes on the trust or police-abuse predictors. SD rows: standard deviations of the country intercepts, the country slopes and the residual. Outcomes and trust measures standardized within dataset. Standard errors in parentheses. Outcome: satisfaction with democracy. Each column interacts the trust measure it names with the moderator. Non-white: any ethnic identification other than White, against White; respondents without one are excluded.
